

# Planning for the future of New Jersey

Climate change is a global challenge, but the impacts are experienced locally. Changes in precipitation, extreme temperatures, sea-level rise, and species shifts place stress on infrastructure, natural resources, and social and economic systems. These same impacts will directly affect public health and healthcare systems. Decisions about zoning, redevelopment, housing, open space, and other investment decisions made by local and regional governments will alter the impacts of climate change on their own and neighboring. Integrating climate change into these decisions and all local and regional planning efforts is imperative to ensure that investments made today are designed to withstand the conditions of tomorrow.

Resilient NJ is an assistance program to support local and regional climate resilience planning. Using the best available science on precipitation, temperature, and sea-level rise, Resilient NJ can help your community plan for how the changing climate may affect residents, businesses, and the natural and built environments in your area.
