Income, Earnings, Poverty and Health Insurance Coverage in New Jersey: 2008

by Sen-Yuan Wu, Division of Labor Market and Demographic Research

The 2008 American Community Surveys (ACS) data were released by the US Census Bureau recently. The ACS is the largest survey in the United States, with an annual sample size of about three million addresses across the United States and Puerto Rico, and is conducted in every county throughout the nation. As part of the 2010 Decennial Census Program, the ACS has replaced the traditional decennial census long form. The ACS collects detailed social, economic, housing, and demographic information previously collected by the decennial census long form, but it provides up-to-date information every year rather than once a decade. The ACS data are available for nearly 7,000 areas including all congressional districts, counties, cities and American Indian/Alaska native areas of 65,000 population or more.

This article presents 2008 ACS data regarding median household income, median family income, per capita personal income, income inequality, personal earnings, poverty and health insurance coverage in New Jersey and its 21 counties as well as the 20 New Jersey municipalities with populations of 65,000 or more. Comparisons among New Jersey, the US and other states are also included as appropriate.

Median Household Income, Median Family Income and Per Capita Personal Income

According the 2008 ACS, the median household income (in 2008 inflation-adjusted dollars) for New Jersey (\$70,378) was the second highest in the nation, next only to Maryland (\$70,545), and was 35 percent above the national median (\$52,079). Twenty-two states, including seven Northeastern states, had a median household income above the US median. Mississippi — with a median income of \$36,338 — was at the bottom of the 29 states with a median household income lower than the US median.

Between 2007 and 2008, median household income increased by a statistically significant \$793 in New Jersey. However, median household income declined somewhat in the nation as a whole, from \$52,673 in 2007 to \$52,079 in 2008.

All racial groups in the nation experienced a decline in median household income between 2007 and 2008. In spite of the decline, Asian households continued to have the highest median income (\$65,637) among racial/ethnic groups while the median income for Hispanic households (\$37,913) and black households (\$34,218) remained low in 2008. The median household income for the nation's non-Hispanic whites was \$55,530.

New Jersey, Maryland and Connecticut led the nation in household income, family income and per capita personal income (table 1). New Jersey's 2008 median family income (\$85,761) was the highest among the 50 states and District of Columbia, followed by Connecticut's \$85,344 and Maryland's \$84,415. Next only to the District of Columbia, Connecticut, in turn, had a higher per capita income (\$37,393) than New Jersey (\$35,179) and Maryland (\$34,508). Mississippi continued to have the lowest median family income (\$46,668) and per capita income (\$20,228) in the nation in 2008.

| State | Income | State | Income |
|-------------------------|----------|------------------------|----------|

| Maryland | \$34,508 | Kentucky | \$22,603 |
| Massachusetts | \$34,452 | Idaho | \$22,748 |

Among New Jersey's 21 counties, Hunterdon (\$102,683) and Somerset (\$100,608) were the only counties with six-digit median household incomes in 2008 (table 2). Cumberland (\$50,833) and Atlantic (\$52,696) had the lowest median household income in the state. Five counties had their 2008 median family income exceeded \$100,000: Hunterdon, Somerset, Morris, Monmouth and Bergen; while Cumberland (\$58,122) and Hudson (\$60,423) were at the other end of the family income spectrum. The same five counties had the state's highest per capita personal income in 2008, while Cumberland (\$21,162) and Atlantic (\$26,449) took the back seats in the ranking of per capita income by county.

Middletown Township led the state's 20 "large municipalities" (with 65,000 population or more) with a median household income of \$97,056 in 2008, followed by Cherry Hill Township (\$90,470); while Camden City (\$24,283) and Passaic City (\$29,904) had substantially lower median household income. Middletown and Cherry Hill also had the highest median family income and per capita personal income in the state. However, per capita income in Cherry Hill was slightly higher than that in Middletown although Middletown had the highest median family income. Not surprisingly, Camden and Passaic also had the state's lowest median family income and per capita personal income in 2008.

Income Inequality

Household income has never distributed equally in the US or in any state. Based on the 2008 ACS, the nation's Gini index¹ was 0.469, virtually unchanged from 0.467 in 2007 (table 3). The top 21 percent households in the nation had income more than \$100,000 each, while every household at the bottom 23 percent had income less than \$25,000 in 2008. With Gini indexes higher than 0.5, the District of Columbia (0.540) and New York (0.503) had the steepest income inequality in the nation. The nation's lowest Gini indexes were found in Alaska (0.403) and Utah (0.411). With a Gini index of 0.464, New Jersey had a more equal distribution of household income than fourteen other states and the District of Columbia. About one-third of households in the state had an income of \$100,000 or higher, and one-sixth of households had an income of \$25,000 or less in 2008.

Among the counties in New Jersey, Essex (0.530) and Hudson (0.488) had the most skewed income distribution while household income in Sussex (0.387) and Gloucester (0.389) were the most evenly distributed. The townships of Gloucester (0.353) and Hamilton (0.359) had very low Gini indexes, while the indexes were high in Jersey City (0.487) and Passaic (0.484).

Median Earnings

Earnings — the sum of wage and salary income and self-employment income — are often the largest part of overall income. The 2008 ACS showed that 84 percent of New Jersey's aggregate household income came from earnings.

New Jersey's full-time year-round male workers had the third highest median earnings in the nation (\$55,980) — next only to Connecticut and the District of Columbia — and were about 23 percent higher than the national median of \$45,556 (table 4). Arkansas (\$36,839) and Mississippi (\$37,436) had the nation's lowest median earnings for men, as of 2008.

The level of women's median earnings was even more dispersed across states and the District of Columbia. The District of Columbia had the highest median earnings for women – \$50,519, which was about 42 percent higher than the national median of \$35,471 and 84 percent higher than West Virginia's \$27,472 (the lowest in the nation). New Jersey ranked third nationally in women's median earnings (\$44,343), next to the District of Columbia and Connecticut (\$44,625).

Nationally, women earned about 77.9 cents for every dollar that men earned. The earning disparity between men and women in New Jersey (women earned 79.2% of men's median) was relatively milder. Women in the District of Columbia earned 88 cents for every dollar men earned — the highest in the nation, while women in Wyoming only earned 64.3 percent of men's earnings (the lowest among the 50 states and District of Columbia).

Hunterdon County had the highest median earnings for both men (\$82,019) and women (\$63,683) among the state's 21 counties. The median earnings in Cumberland County were the lowest for men (\$41,805) and women (\$33,650). Women's earnings were closest to men's earnings (96.5%) in Cape May County than in any other county in New Jersey, and were most departed from men's earnings in Monmouth County (65%).

Among New Jersey's 20 larger muncipalities, Old Bridge Township (Middlesex County) had the highest median earnings for men (\$72,887) and women (\$55,560). Camden City had the lowest median earnings for men (\$24,726) while Passaic City had the lowest median earnings for women (\$22,154). Women had higher median earnings than men in three New Jersey municipalities – Lakewood Township, Trenton City and East Orange City.

Asian men and women had higher median earnings than their counterparts in other race/ethnic groups in New Jersey (table 5). Men of "some other race" and the Native Hawaiian & Pacific Islander women had the lowest median earnings. The men-women earnings gap was the smallest among African Americans, while Native Hawaiian & other Pacific Islander women earned less than one-third of their male counterparts.

Higher educational attainment leads to higher earnings for both men and women (table 5). The median earnings for persons with a graduate or professional degree (\$97,295 for men and \$62,423 for women) were 3.6 times of that for persons without a high school diploma (\$26,933 for men and \$17,444 for women). Higher education also helped women close their earnings gap with men, with the exception of graduate degree holders.

By occupation, the management, business and financial occupations had the highest median earnings for both men and women, while the service occupations had the lowest earnings (table 6). The earnings gap between men and women was the largest among workers in production, transportation and material moving occupations while women in construction, maintenance and repair occupations had higher median earnings than their male counterparts.

By industry, workers in the information industry had the highest median earnings overall (table 6). However, men earned the most in the financial, insurance and real estate industry (\$82,605), while women in public administration had the highest median earnings (\$50,434). The art, entertainment, recreation and accommodation industry had the lowest median earnings for both men and women. Men earned more than women in all industries. The largest earnings gap between men and women was found in the agriculture, forestry and fishing industry (52.3%). In contrast, women in the construction industry earned as high as 82.3 cents for every dollar that their male counterparts earned.

Number and Percentage of People Below Poverty

The increase in the nation's poverty rate between 2007 and 2008 was the first statistically significant annual increase since 2004. The 2008 poverty rate (13.2%) was the highest since 1997. According to the 2008 ACS, poverty rates² among the 50 states and the District of Columbia ranged from a low of 7.6 percent in New Hampshire to a high of 21.2 percent in Mississippi (table 7). New Jersey's 8.7 percent poverty rate (741,472 persons) in 2008 was virtually unchanged from 8.6 percent in 2007, and was the fourth lowest in the nation. Similar to the national pattern, New Jersey had uneven poverty rates among racial and ethnic groups: whites – 6.3 percent, blacks – 17.7 percent, Asians – 5.6 percent, and Hispanics – 16.5 percent.

Somerset (2.3%) and Morris (3.6%) had the lowest poverty rates among the state's 21 counties, while Hudson's 15.2 percent and Essex's 14.8 percent were the highest poverty rates in New Jersey.

Poverty rates varied widely at the municipal level. Among New Jersey's municipalities with 65,000 population or more, Middletown Township had the state's lowest poverty rate (1.7% or 1,214 persons), while the poverty rate in Camden City was the highest at 41.7 percent (or 29,575 persons).

Health Insurance Coverage

Just over 45 million Americans or 15.1 percent of the nation's population were not covered by any health insurance in 2008. The percentage of population without health insurance coverage ranged from 4.1 percent in Massachusetts to 24.1 percent in Texas (table 8). New Jersey's 12.4 percent (or 1.06 million population) was lower than in 28 other states. Private insurance covered more than 6.45 million New Jersey residents and public insurance covered more than 1.87 million in New Jersey in 2008.

Hunterdon County's 5.7 percent uninsured rate was the state's lowest in 2008, followed by Somerset (7.2%) and Morris (7.2%). Hudson County had the highest percentage of uninsured residents (19.5%), followed by Passaic County (18.8%). The percentage of uninsured residents varied widely among New Jersey's 20 large municipalities — from 3.1 percent in Cherry Hill Township to 35.4 percent in Passaic City. Elizabeth City also had more than one-third of uninsured residents (34.2%) in 2008.

Data Availability

The 2008 American Community Survey data including income, earnings, poverty and health insurance coverage can be found online at American Fact Finder: http://factfinder.census.gov.

The Annual Demographic Profile for New Jersey and its 21 counties, based on the American Community Survey are available online at the Office of Labor Planning and Analysis' web site (http://lwd.dol.state.nj.us/labor/lpa/dmograph/Demographics_Index.html). For more information regarding income, earnings and poverty in New Jersey, contact the New Jersey Department of Labor and Workforce Development, Division of Labor Market and Demographic Research, P. O. Box 388, Trenton, NJ 08625-0388, telephone 609-292-0076, e-mail: sywu@dol.state.nj.us.

Footnotes:

- 1. The Gini index is a summary measure of income inequality. It indicates how much the income distribution differs from a proportionate distribution (one where everyone would have the same income; for example, 20 percent of the population would hold 20 percent of the income, 40 percent of the population would hold 40 percent of the income, etc.). The Gini index varies from 0 to 1, where 0 indicates perfect equality (a proportional distribution of income), and 1 indicates perfect inequality (where one person has all the income and no one else has any).
- 2. Poverty rate refers to the percentage of persons living below poverty threshold. Poverty thresholds vary by family size and composition but do not vary geographically. The 2008 poverty thresholds were \$22,025 for a family of four, \$17,163 for a family of three, \$14,051 for a family of two, and \$10,991 for unrelated individuals.

any experts believe the national recession is easing and that signs of recovery could be evident in the advance third quarter GDP estimates to be released in late October. While the overall economy may be improving, the unemployment rate is expected to continue to rise well into next year and there are still a number of indicators, such as mortgage

foreclosures and consumer confidence that will need to be monitored closely. The Conference Board's Leading Economic Index increased by 1.0 percent in September and has now increased for six months in a row. The six month growth is at its fastest pace since 1983, when the economy was emerging from the steep 1981/1982 recession.

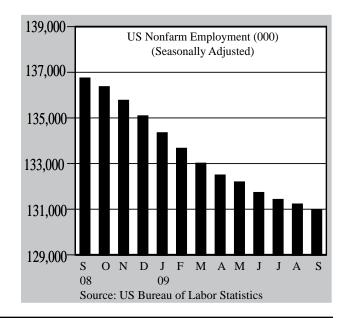

The Conference Board's Consumer Confidence Index declined slightly in September, following a gain in August. The September index, 53.1, is up from record lows in February 2009 and is comparable to the levels of a year ago when the index began dropping as the economy worsened. Consumers are more positive in their longer-term outlook but are still concerned about present conditions.

Retail sales often reflect changing consumer sentiment. The Census Bureau reported that retail sales for September were down 1.5 percent from August and down 5.7 percent from September a year ago. Excluding motor vehicle and parts sales, which declined sharply, as expected, following the expiration of the federal government's "cash for clunkers" program, retail sales were up 0.5 percent. The Bureau of Economic Analysis (BEA) report on personal income and outlays showed increased consumer spending on goods over the four month May through August period.

In the second quarter, the economy was declining at a slower rate than first believed. The final estimate for second quarter GDP was revised upward from a -1.0 percent decline

in the preliminary estimates to a -0.7 percent decline in the final estimates. Estimates for third quarter GDP are expected to show annualized growth in the 3.0 percent range.

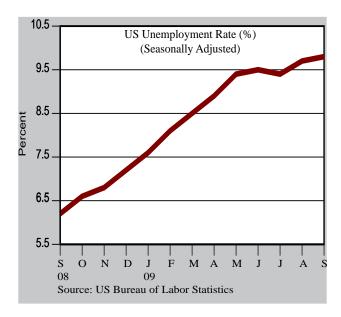

Employment in September declined by 263,000 jobs, following the loss of 201,000 jobs in August. Over the May through September period, job losses have averaged 307,000 per month, a sharp reduction from the 645,000 jobs lost, on average, each month from November of last year through this April. Employment declines are expected to continue at least through the early part of next year. Through the first nine months of this year, 4.1 million jobs have been lost, and since the recession began, the economy has shed 7.2 million jobs.

Employment declines by industry continued to be widespread. Construction and manufacturing again suffered large employment declines of 64,000 and 51,000 each, respectively. Retail trade lost 39,000 jobs. In September, employment growth was limited to education and health services which added a modest 3,000 jobs.

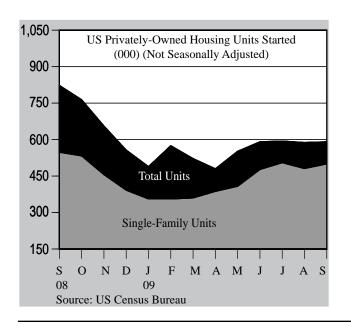

The unemployment rate continued to rise, reaching 9.8 percent in September, up from 9.7 percent in August and 6.2 percent from the same month a year ago. The number of unemployed workers eclipsed 15 million, the highest total in the post-World War II era. The percentage of unemployed 27 weeks or more increased to 35.6 percent in September. A broader measure of unemployment, which includes discouraged and part-time workers, increased to 17.0 percent in September. Most forecasters call for the unemployment rate to increase through the end of this year.

Inflation continued to be under control in September. For the month, prices were up 0.2 percent, following no increase in July and a gain of 0.4 percent in August. Over the year,

the overall price level is down 1.3 percent due to declining energy prices. The core inflation index, which excludes volatile food and energy cost, is up a modest 1.5 percent. The absence of inflationary pressure, for the time being, means the Federal Reserve Board can keep interest rates low without worrying about the threat of higher inflation.

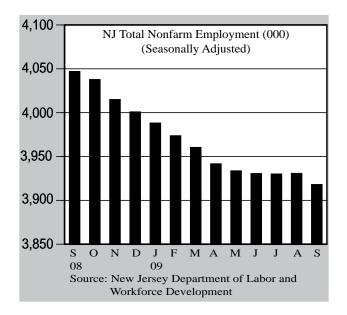

The Census Bureau reported that construction spending in August, at an annualized rate of \$941.9 billion, was up 0.8 percent over July and down 11.6 percent from August a year ago. Year-to-date, spending was down 11.9 percent through the first eight months of this year. The Census Bureau's report on new residential construction was somewhat disappointing in September. Building permits and housing completions declined while housing starts were up

a modest 0.5 percent. However, the National Association of Realtors report on existing home sales in September was encouraging. Existing home sales increased for the fifth time in the last six months. Sales activity was at its highest level since July of 2007, and the inventory of unsold homes was down.

RealtyTrac reported that mortgage foreclosures nationally increased five percent in the third quarter and were up almost 23.0 percent from the third quarter a year ago. Rising unemployment has replaced subprime loans as the primary source of foreclosure activity. The peak in foreclosures is not expected until the fourth quarter of 2010.

Imployment trends in New Jersey are generally following national trends. The rate of decline in nonfarm payrolls is slowing. In fact, prior to a large September decline, monthly losses had been shrinking and there was a small employment increase in August. Like the nation, New Jersey's unemployment rate has continued to rise. In September, the national

and state unemployment rates were equal at 9.8 percent. Most experts are forecasting high unemployment well into next year although output is expected to be growing. Additionally, a high level of mortgage foreclosures, driven in part by continued high levels of unemployment, is expected well into next year.

The Federal Reserve Bank of Philadelphia's leading index for New Jersey was up 0.3 in August. Overall, the index suggests some growth in the state's economy through the second quarter of 2010. However, the coincident index for August was still negative.

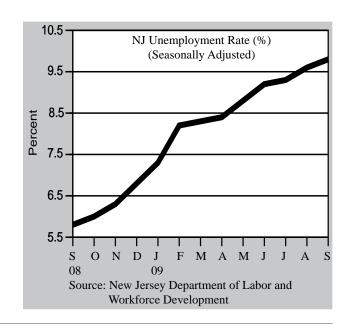

In September, employment declined by 12,700, following two months of little change. The 12,700 job loss was comparable

to those of the January-April period when job losses averaged 14,800. Employment in August did increase for the first time since January of 2008. Year-to-date, nonfarm payroll employment is down 3.1 percent in New Jersey and 3.8 percent nationally.

The September declines were led by job losses of 4,000 both in construction and in other servcies, which includes repair and maintenance and personal and laundry services. Professional and business services (-2,600) and trade, transportation, and utilities (-2,200) also had relatively large losses. Financial activities (+1,200) and leisure and hospitality (+1,000) added jobs. Public sector employment was down 700 in September, and is down 7,700 from this time last year. Most of the decline is attributable to the loss of 5,200 jobs in state government.

Year-to-date employment in both construction and trade/transportation/utilities were down 12.5 percent. Professional and business services employment was down by a relatively steep 5.9 percent. Education and health services was the only major sector which had higher employment through the first nine months of 2009 although the gain was a modest 1.3 percent.

Since the recession officially began in December of 2007, New Jersey employment is down by 168,500 jobs or 4.1 percent. Over the same period, national employment is down almost 7.2 million jobs or 5.2 percent. Private sector service-providing industries lost 97,000 jobs while employment in goodsproducing industries was off 64,500 jobs.

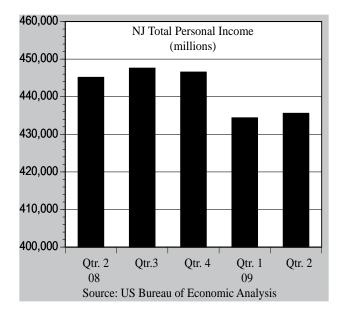

Public sector employment declined by 7,000 jobs. On a percentage basis, employment in the goods-producing industries was off a steep 13.5 percent while private sector service-providing employment was down 3.3 percent.

New Jersey's unemployment rate increased to 9.8 percent in September, up from a revised 9.6 percent in August. The September rate matches the national rate and is the highest since April 1977 when the state's unemployment rate was 9.9 percent.

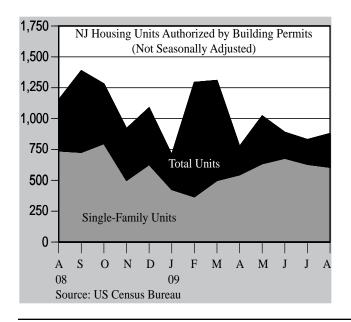

In September, the number of unemployed New Jersey residents increased by 8,000, rising from 436,900 in August to 444,900 in September. Resident employment declined by 14,000 in September, while labor force participation was essentially unchanged.

Based on county data that is not seasonally adjusted, thirteen of New Jersey's 21 counties had unemployment rates less than 10.0 percent in September. The remaining

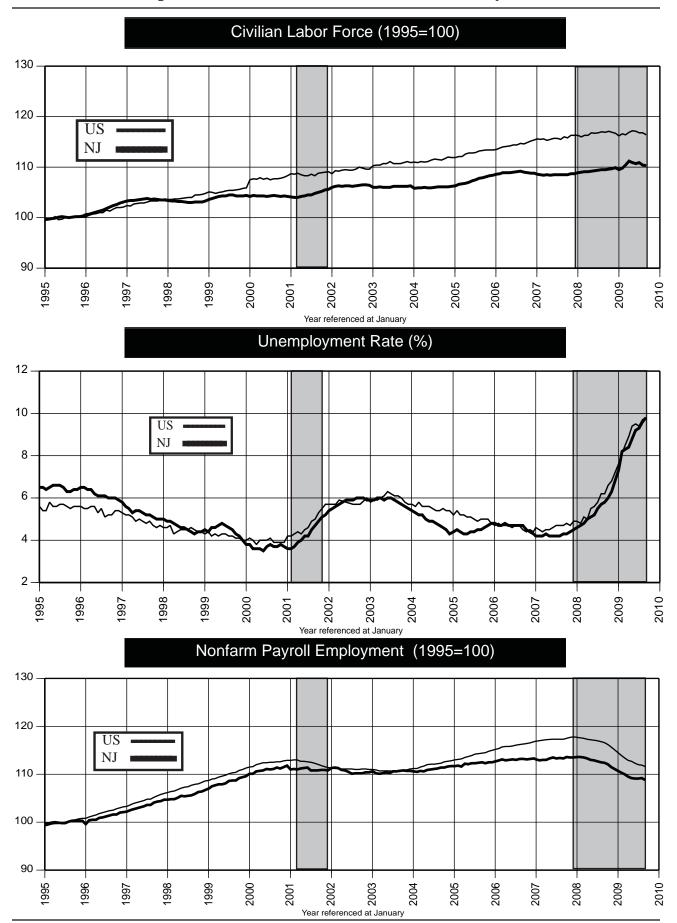

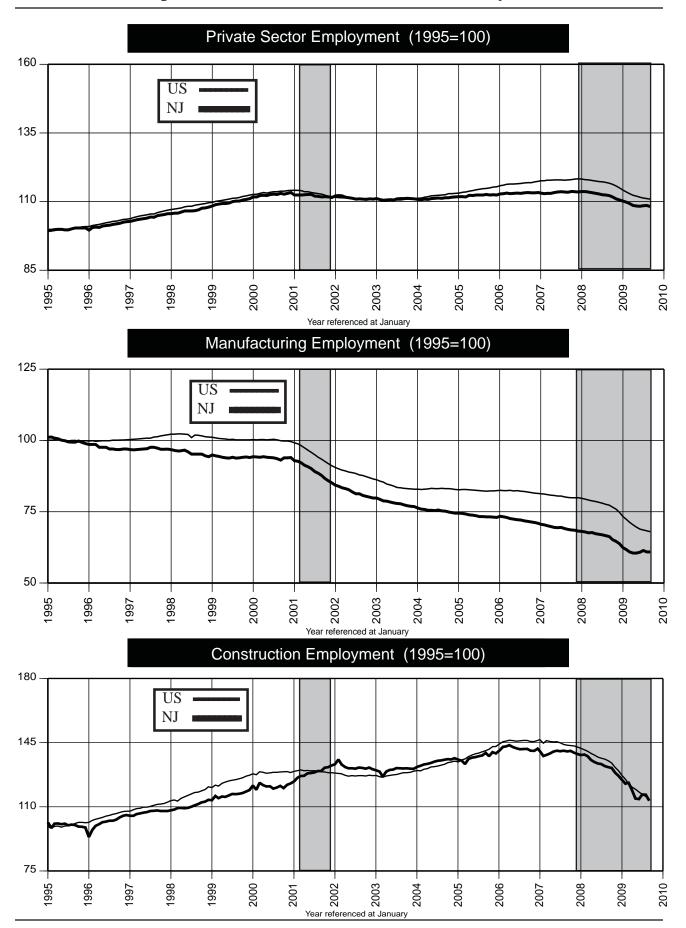

eight had unemployment of 10.0 percent or more. The statewide unemployment rate on a not seasonally adjusted basis was 9.6 percent. Generally, counties in the central region of New Jersey, such as Hunterdon (6.9%) and Somerset (7.9%) had lower unemployment rates. Counties in the southern and northeastern regions tended to have higher unemployment rates. Cumberland, at 12.6 percent, had the state's highest unemployment rate in September.

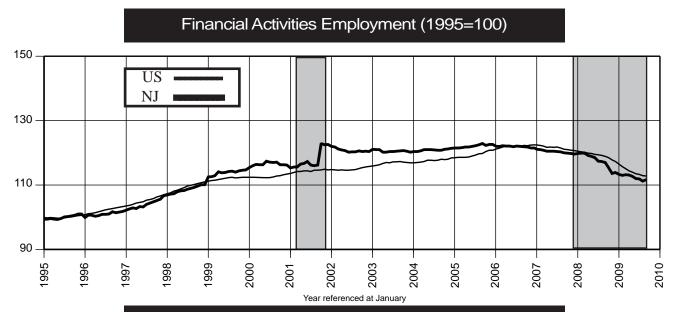

New Jersey's total personal income in the first half of this year was down 2.2 percent over the same time in 2008. Nationally, total personal income was down 2.1 percent over the same period. Like most states, total personal income was down sharply in the first quarter of this year but rebounded in the second quarter. Moving forward, slow growth may be expected as the nation and state slowly emerge from the recession.

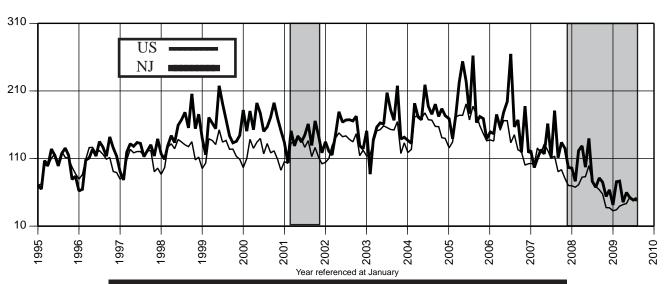

Through August, residential building permits in the state were down 43.9 percent compared with the first eight months of 2008. Permits for single family units were down 32.4 percent. In the Northeast region, building permits were unchanged in September and down 32.6 percent over the year. Housing starts in the Northeast were down 5.5 percent over the month and 38.4 percent over the year and housing completions were up 29.2 percent, the nation's largest increase among the areas, and down 24.3 percent over the year. September existing home sales in the region were up 4.4 percent from August and 11.8 from a year ago. The median sales price was down 7.0 percent from last year.

Notes:

- Nonfarm payroll employment includes civilains on nonfarm establishment payrolls who worked or received pay for any part of the pay
 period including the 12th of the month. It excludes proprietors, self-employed, unpaid family members and domestics in private households. All data are revised to March 2008 benchmarks. Individual series may not add to sector or supersector totals because not
 all sector/supersector components are published.
- 2. "Other Services" include: Repair and maintenance; Personal and laundry services; Religious, grantmaking, civic, professional and similar organizations.
- 3. The total number of state employees reported under this heading is determined on the basis of a definition developed by the US Bureau of Labor Statistics which is standardized throughout the nation. The definition includes both full- and part-time workers in the executive departments, the legislature, and the judiciary, as well as all employees of authorities, commissions, the state universities and colleges, and other agencies not included on the central payroll.
- * Seasonally adjusted total has been indirectly computed from the sum of the underlying industries.
- ** The industry is not seasonally adjusted because seasonality is not statistically significant.

^{*} Eight manufacturing production series were deleted because these series failed to meet the criteria established by the Bureau of Labor Statitstics and will no longer be published.

⁽¹⁾ Average hours worked or paid are affected by labor turnover, changes in overtime hours and part-time employment.

⁽²⁾ Hourly earnings include paid holidays, vacation and sick leave. They are affected by changes in workforce composition and in wage rates.

⁽³⁾ Weekly earnings are affected by premium pay, shift differentials, piecework and incentive payments, length of workweek and other factors.

⁽⁴⁾ Non-supervisory workers. The Information Supersector includes the Publishing Industries, Telecommunications, and Internet Service Providers, Web Search Portal, and Data Processing Service Sectors.

Notes: Totals may not add due to seasonal adjustment, rounding and differences in the availability of data.

^{*} Not seasonally adjusted

Statistical Section Notes

Adjustment of Data

Seasonal Adjustment. All tables/charts, unless otherwise specified, contain data that are seasonally adjusted using the **X-12 ARIMA** (Auto-Regressive Integrated Moving Average) method of seasonal adjustment developed by Statistics Canada.

The **X-12** procedure was used in a "two-step" process. One set of factors was generated for benchmarked estimates, based on absolute or universe counts of employment determined through Unemployment Insurance records. These factors were used to seasonally adjust historical, universe-based data through September 2007. A second set of factors was generated using the record of sample-based estimates, and applied to reprojected sample-based estimates for the last quarter of 2007 and sample-based estimates developed month by month in 2008.

Annual Revision and Internet Access

Annual revisions of the data series in *Economic Indicators* normally incorporate:

- (1) the latest benchmark 2008 for the Resident Labor Force Indicators (Series 1-6) and 2008 for Establishment Employment Indicators (Series 7-16).
- (2) new seasonal adjustment factors, which usually affect at least five years of seasonally adjusted data, or the period from January 2004 forward.

Internet Access: Available on the Labor Planning & Analysis (LPA) Web site, **http://lwd.dol.state.nj.us/labor/lpa**, are:

- (1) the current month's *Economic Indicators* issue.
- (2) historical series when available, January 1976 to December 2008. This includes the latest annual revisions to unadjusted nonfarm data (January 2006 to December 2008) and seasonal adjustment revisions (January 2004 to December 2008). Because revisions can affect various multi-year periods of original and seasonally adjusted data, it would be incorrect to generate a historic time series for *Economic Indicators* data by tying together series from old issues. For example, seasonally adjusted data from January 2005 to December 2009 are subject to change during the next annual revision cycle.

General Notes

Annual Averages. On p. S-20 are the annual averages of the of the data series for recent years to be used as a benchmark for evaluating current monthly data.

Charts. Unless otherwise noted, all graphs were developed with seasonally adjusted data.

Moving Averages. Series where the monthly data vary erratically have been plotted with moving averages (thick line) and nonaveraged data (thin line) superimposed.

Scales. The scale of each series is determined by the volume and trend of the data series. Caution should be exercised in making comparisons among charts of different scales.

Shaded Columns. Shaded areas indicate periods of general national contraction as identified by the National Bureau of Economic Research (NBER). The July 1990-March 1991 and the March 2001-November 2001 national recessions are shown in the graphs for Series 1-27.

Tables. Revised data are indicated by an "R" after the entry.

Data Sources for Economic Time Series 1-27

1-6 **Resident Labor Force Indicators** are produced using a modeling procedure based on regression techniques, that allows for the construction of error ranges. This procedure includes data variables from the NJ Department of Labor & Workforce Development's monthly Current Employment Statistics (CES) survey, unemployment insurance claims data and responses from the US Bureau of labor Statistics' Current Population Survey (CPS) of 1,500 households in New Jersey. A new method was introduced effective with January 2005 estimates. Data are available monthly back to 1976.

Beginning with 1990, data incorporate 2000 census-based population controls as well as improved estimates of immigration, emigration, births and deaths for the state and are not directly comparable to earlier figures.

The **Labor Force Participation Rate** and the **Employment/Population Ratio** (Series 4 and 5) are expressed as percentages of the civilian noninstitutional population aged 16 years and over.

7-16 The **Establishment Employment Indicators** are generated from the monthly CES survey of employers on the number of persons who worked or received pay for any part of the pay period including the 12th of the month.

Data reflect March 2008 benchmarks.

You're viewing an archived copy from the New Jersey State Library. **Statistical Section Notes (cont.)**

Seasonally adjusted data for Series 7-16 have been revised back to January 2004. Not seasonally adjusted data have been revised back to 2006.

Private Sector Nonfarm Payroll Employment (Series 8) is computed by subtracting government employment from total nonfarm employment.

Standard errors have been computed to estimate the variance of total private sector employment and for all supersector series statewide, as well as for total private sector employment for Metropolitan Statistical Areas. More detailed information is available at lww.lusv/labor/lpa under "Employment & Wages". Please see the technical note on sample variance.

The Consumer Price Index for All Urban Consumers (CPI-U) is a measure of the average change over time in the prices paid by all urban consumers (excluding military personnel and persons in institutions) for a fixed market basket of consumer goods and services. The month-to-month change in the CPI is a measure of inflation. Beginning with January 2007, monthly data is reported out to three decimal points.

The **CPI-U** represents approximately 87% of the total population. The **US CPI-U** is the US City Average. The **US CPI-U** and **Metro Area CPI-U** (see definitions below) are not seasonally adjusted.

The CPI does not measure the relative cost of living between areas. There is no "New Jersey CPI". The division of New Jersey's 21 counties between two metropolitan areas for which CPIs are calculated is defined below.

Internet: US Bureau of Labor Statistics Web site may be accessed at http://www.bls.gov/data/top20. htm for all regional and national CPI data.

Metro Area definitions:

"NY" designates the *New York-Northern New Jersey - Long Island, NY-NJ-CT-PA area*. In New Jersey this includes Bergen, Essex, Hudson, Hunterdon, Mercer, Middlesex, Monmouth, Morris, Ocean, Passaic, Somerset, Sussex, Union and Warren counties. In New York, it includes New York City (5 counties), Dutchess, Nassau, Orange, Putnam, Rockland, Suffolk and Westchester counties. In Connecticut, it includes Fairfield and New Haven counties, plus parts of Litchfield and Middlesex counties. In Pennsylvania, it includes Pike County. Data are published monthly.

"PA" designates the *Philadelphia-Wilmington-Atlantic City, PA-NJ-DE-MD area*. In New Jersey this includes Atlantic, Burlington, Camden, Cape may, Cumberland, Gloucester, and Salem Counties. In Pennsylvania, it includes Bucks, Chester, Delaware, Montgomery and Philadelphia counties. In Delaware, it includes New Castle County, and in Maryland, Cecil County. Data are published bi-monthly.

Consumer Confidence Index (CCI), (US 1985=100) is based on a representative, random sample of 5,000 US households surveyed monthly by TNS for the Conference Board. The index represents consumers' perceptions of the present general economy, their own financial conditions as well as their short-term (six months) outlook. Economists use the CCI as a leading indicator for consumer spending.

19-21 The **Residential Building Permits Indicators** are compiled by the US Bureau of the Census, Manufacturing and Construction Division as of the thirteenth workday of the following month. Data are collected for all permit-issuing places in the state through a monthly survey of local construction officials. If data are not received for a particular place for that month, the data are imputed. The Census Bureau conducts an annual follow-up to obtain as much data as possible for places for which the data were imputed during the year; these data are then considered to be **FINAL MONTHLY FIGURES**. (Final statewide totals used to produce the annual averages on p. S-20 also include "undistributed" units.) Data beginning January 1998 contain revisions allocated back to prior months and are directly comparable to over-the-year changes shown on the **New Jersey's Economy by the Numbers** table.

Total Private Dwelling Units Authorized by Building Permits (Series 19) data are the sum of single-family, two-family, three-or-four-family, and five-or-more-family dwelling units. Public housing units are not included in the series and represent a tiny fraction of the total.

Private Multi-Family (5+ units) Authorized by Building Permits (Series 21) include all multi-family structures with five or more units, except those in public housing. Data do not exhibit a stable seasonal pattern and are, therefore, not appropriate for seasonal adjustment.

22-24 These series on **New Passenger Car & New Light Truck/Van Registrations** present data only on total new passenger cars and total light truck/vans (in the gross vehicle weight class 0-10,000 lbs.) registered in New Jersey, regardless of the state in which the sales occur. Included are both domestically produced and imported vehicles. Excluded are all federal government registrations. Monthly data for current and prior-year are subject to revision.

Because of unemployment insurance (UI) coverage and other law changes affecting eligibility for benefits, data on unemployment insurance claims (Series 25-27) may not be directly comparable between years.

Weeks Claimed (Weekly Average) is computed by dividing the total number of weeks claimed (intrastate and interstate agent under the Regular State UI Program only) in the month by the number of weeks in the month.

The **Insured Unemployment Rate (IUR)** is the seasonally adjusted weekly average of weeks claimed (intrastate and interstate agent claims under the Regular State UI Program only), which is a proxy for a count of claimants, as a percent of employment covered by unemployment insurance.

- The **Initial Claims Weekly Average** represents intrastate and interstate agent claims under the Regular State UI program only.
- 27 **Unemployment Insurance Exhaustions** are for the Regular State UI Program only.
