## ***ACKNOWLEDGMENT***

This report was prepared by Dr. Sen-Yuan Wu of the New Jersey Department of Labor's Division of Labor Market and Demographic Research. Assistance was provided by the Division's *Projections 2006* team: Robert Vaden; Thomas Sheppard, Jr.; Jim Dougherty; Indra Ramaswamy; Leonard Preston, Ruth Schwartz and Stephen Bamgbade. In addition, the projections reflect many of the comments and suggestions provided by private and public experts in the state and local economy and demography including the New Jersey State Data Center county contacts who participated in the Division's Projections Focus Group meetings.

The Division's appreciation also goes to the US Bureau of the Census, US Bureau of Labor Statistics and the New Jersey Department of Health and Senior Services for providing valuable input data to the projections.

## INTRODUCTION

This report presents population and civilian labor force projections for the 21 counties in the state of New Jersey from 1996 to 2000, 2006 and 2010. The projections were developed by the New Jersey Department of Labor, Division of Labor Market and Demographic Research as part of the Department's economic and demographic projections series. Projections prepared by this Division include employment by industry, employment by occupation, population by age-race-sex and Hispanic origin, and civilian labor force by age-race-sex and Hispanic origin. These projections share input data and assumptions and are therefore consistent with each other. The flow chart in Appendix 1 (page 167) illustrates the interrelationship among the Division's 2006 projections. In addition, the data concepts and reconciliation of the projected demographic and economic trends are presented in Appendix 2 (page 168). These data supersede all projections previously issued by this Department.

This report (Volume II, Part B) is the second of two reports on population and labor force projections. It includes the county-level projections based on the Economic-Demographic projection Model. The concepts, procedures and input data of the projection model are described in Appendix 3 (pages 169-172).

These projections are the first demographic projection series prepared based on the 1996 estimates and include both race and Hispanic origin projections. The race and Hispanic origin projections were prepared separately in our *Projections 2005* series (published in 1997). The 1996 population and labor force estimates are consistent with 1990 census data and the base year for employment projections. The race and Hispanic origin groups included in the projections are white non-Hispanic, white Hispanic, black, "other races" and

total Hispanic. The "other races" include Asian, Pacific Islander, American Indian, and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. The age and race distribution of the April 1, 1990 population is different from that of the census counts because they were modified to be consistent with other data sources. A detailed description of the background and procedures for race and age modifications is presented in Appendix 4 (pages 173-196).

*The numbers in this report are projections, not forecasts or predictions.* A projection is the measurement of a future condition that would exist if the assumptions and procedures of the method proved to be empirically valid in the future. Projections may assume continuation of past conditions, present conditions, or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgmental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts. Again, numbers in this report are projections, not forecasts.<sup>1</sup>

Furthermore, the projections presented in this report are not designated "official" nor "policy" projections and should not be interpreted

**Numbers in this  
report are  
projections,  
not forecasts  
or predictions.**

<sup>1</sup> Donald B. Pittenger, *Projecting State and Local Populations* (Cambridge, MA: Ballinger Publishing Co., 1976) and Richard E. Klosterman, *Community Analysis Planning Techniques* (Savage, MD: Rowman and Littlefield, 1990).

as goal or policy oriented. They are not intended to constrain or to advocate specific levels of growth in the state. All series are presented as **baseline**, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen, or undocumented nature or magnitude. They are based primarily on identifiable demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, research, program evaluation, and considerations for alternative growth scenarios which could be achieved through greater or less resource development.

### Presentation of Results

This report provides summary tables for all counties including total population (Table 1) and labor force (Table 5), as well as some detail by age, and by race-sex for population (Tables 2 and 3) and labor force (Tables 6 and 7). The detailed projections of population and civilian labor force by age-race-sex-Hispanic origin are given in Tables 4 and 8. The summary tables (1 and 5) provide projected total population and labor force for 2000, 2006 and 2010, the 1990 census figures (modified), as well as the 1996 estimates. Tables 2 and 6 provide a distribution by 18 and 6 age groups for population and labor force, respectively. Tables 3 and 7 provide a distribution by race, sex and Hispanic origin. Table 4 contains age-race-sex and Hispanic origin details, five-year age groups, for 1990, 1996, 2000, 2006 and 2010. The same age, race, sex and Hispanic origin tabulations for civilian labor force, 1996 to 2010 are presented in table 8. However, labor force is divided into 6, instead of 18 age groups. Racial groups in certain counties were aggregated whenever their base-year population and/or labor force were too small to produce reliable projections by age and sex for individual races and/or Hispanic origin. Because of rounding, there may be small discrepancies between projection distributions and totals.

In addition to this publication, the projections data are also available on the *Workforce New Jersey Public Information Network* world wide web site (<http://www.wnjpin.state.nj.us>), and the Office of Labor Planning and Analysis' *Labor Fast Facts* web site (<http://www.state.nj.us/labor/lra>).

### Caution on Interpretation

As noted at the outset, **projections are not forecasts**. In addition, they are not designated "official" nor "policy" projections. The employment projections by county are available for the year 2006 only (see Volume I, Part B). Particular caution is advised in interpreting results for 2000 and 2010. Although they are consistent with the interpolated and extrapolated employment projections for the corresponding years, no actual employment projections were developed for these years. Users of any long-term projections should also be advised that the plausibility of historically based assumptions declines with increasing departure from the base year. Projections are by their nature biased in favor of continuity. There is generally little basis for projecting substantial departures from past trends, so few such departures are projected. Yet, there is little doubt that unforeseen changes may occur. Dramatic changes or disruptions of the current and/or recent economic-demographic conditions in the future such as major natural disasters, wars, or a major overhaul of the nation's immigration policies, etc. could invalidate the projections.

The Division of Labor Market and Demographic Research hopes that users of these projections will comment on them. Please direct all comments, suggestions, and data requests to New Jersey Department of Labor, Division of Labor Market and Demographic Research, P O Box 388, Trenton, New Jersey 08625-0388; phone: 609-292-0076; fax: 609-984-6833; e-mail: [sywu@dol.state.nj.us](mailto:sywu@dol.state.nj.us).

## HIGHLIGHTS FROM THE COUNTY PROJECTIONS

- **Total population is projected to increase in all counties from 1996 to 2006 except Essex County.**

Although the rates of growth will vary, total population in all counties except Essex is projected to grow in the projection period. Bergen County will continue to be the most populous county, with 873,300 residents by the year 2006. With a hefty increase of approximately 73,100 residents, Middlesex County is projected to outgrow Essex County and become the second most populous county in the state by 2006. Three counties — Cape May, Salem and Warren had less than 100,000 population in 1996. By the year 2006, Salem will be the only county remaining in that category; the population in Cape May and Warren counties will reach 101,600 and 104,800, respectively, by 2006. Essex County is projected to experience a modest population decline of 1,400 between 1996 and 2006.

Table A. Total Population (000) by County: 1990, 1996 and 2006

County	Census 1990	Estimates 1996	Projection 2006	Population Change	
				1990-96	1996-06
<b>New Jersey</b>	7,747.8	8,001.8	8,436.6	254.0	434.8
Atlantic	224.3	235.0	260.8	10.7	25.8
Bergen	825.4	846.1	873.3	20.7	27.2
Burlington	395.1	415.6	450.5	20.5	34.9
Camden	502.8	504.8	514.2	2.0	9.4
Cape May	95.1	98.0	101.6	2.9	3.6
Cumberland	138.1	141.2	142.8	3.1	1.6
Essex	778.0	753.7	752.3	-24.3	-1.4
Gloucester	230.1	244.0	263.3	13.9	19.3
Hudson	553.1	549.3	553.8	-3.8	4.5
Hunterdon	107.8	118.8	135.7	11.0	16.9
Mercer	325.8	329.4	338.4	3.6	9.0
Middlesex	671.8	701.6	774.7	29.8	73.1
Monmouth	553.1	589.8	637.5	36.7	47.7
Morris	421.4	448.5	486.2	27.1	37.7
Ocean	433.2	473.5	520.4	40.3	46.9
Passaic	470.9	481.0	486.1	10.1	5.1
Salem	65.3	66.0	66.7	0.7	0.7
Somerset	240.2	270.0	320.8	29.8	50.8
Sussex	130.9	141.0	153.0	10.1	12.0
Union	493.8	496.8	499.6	3.0	2.8
Warren	91.6	97.6	104.8	6.0	7.2

- Counties in the state's Central and Coastal regions are projected to continue to lead in population growth between 1996 and 2006 while the Northeastern counties will continue to grow at a much slower pace.

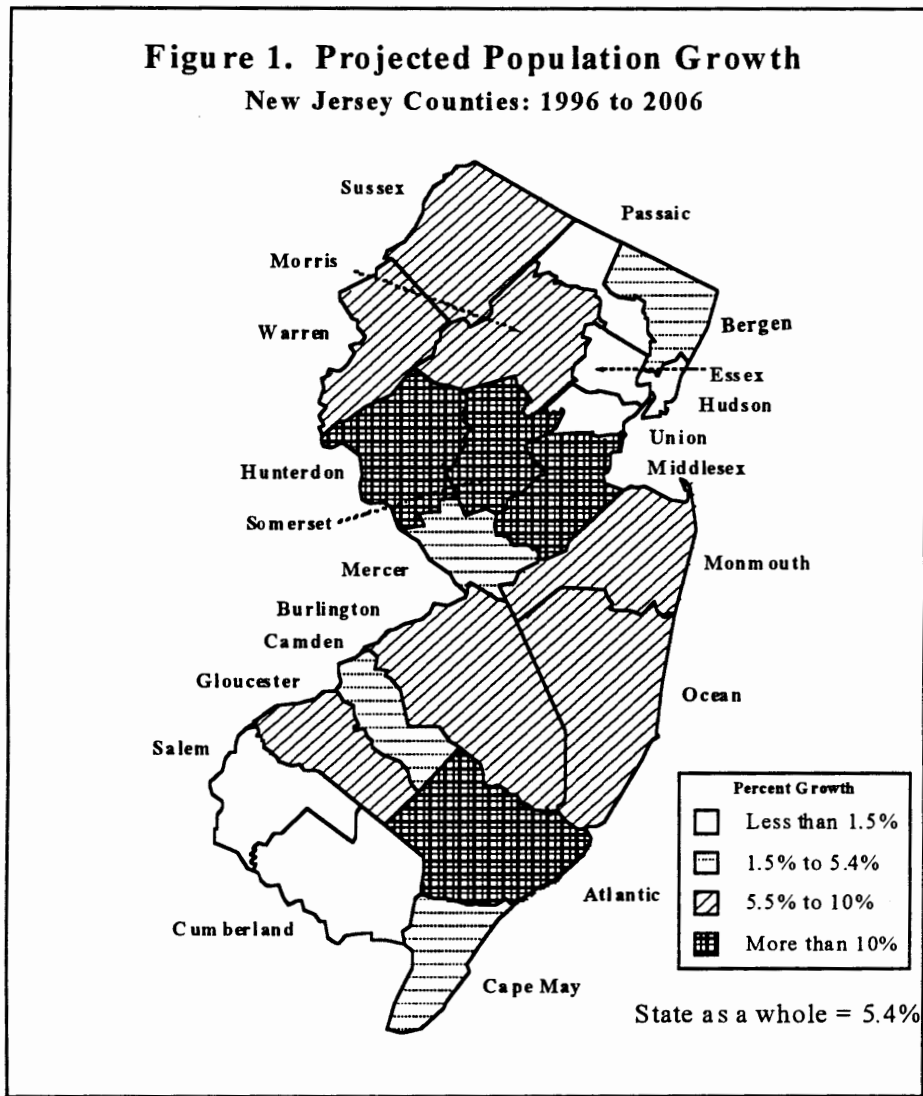

Table B. Rate of Population Growth by Region: New Jersey, 1990 to 2006

Region (county)	Rate of Growth	
	1990-1996	1996-2006
<b>State Total</b>	3.3%	5.4%
Northern (Bergen, Essex, Hudson, Morris, Passaic, Union)	0.9%	2.1%
Northwestern (Sussex, Warren)	7.2%	8.0%
Central (Hunterdon, Mercer, Middlesex, Somerset)	5.5%	10.5%
Coastal (Atlantic, Cape May, Monmouth, Ocean)	6.9%	8.9%
Southern (Burlington, Camden, Cumberland, Gloucester, Salem)	3.0%	4.8%

With a projected 10.5% increase, the Central counties (Hunterdon, Mercer, Middlesex and Somerset) will replace the coastal counties (Atlantic, Cape May, Monmouth and Ocean) as the state's fastest growing region between 1996 and 2006. These four counties will account for more than one-third (34.4%) of the state's total population growth. Population of the Coastal counties is projected to grow by 8.9%, also substantially faster than the state average (5.4%).

Another fast growing region in the state is the Northwestern region, which is comprised of Sussex and Warren counties. Population growth in these two counties is projected to be 8.0% in the 10-year period. Because of their relatively small populations, however, these two counties will account for only approximately 3% of the state's total number of residents by the year 2006.

The population of the Southern region is projected to continue to grow at a rate (4.8%) slightly lower than the statewide growth rate (5.4%). The population decline in the Northern region ceased in the early 1990s. The region is projected to have a moderate population increase (2.1%) from 1996 to 2006.

Somerset County of the Central region is projected to be the fastest growing county in the state with a 1.7 percent average annual growth rate between 1996 and 2006, followed by Hunterdon County (1.3%) and Middlesex County (1.0%) of the same region and the Coastal region's Atlantic (1.0%) and Ocean (0.9%) counties. Essex (-0.01% annually) is the only county expected to experience population declines during the 1996-2006 projection period.

- Ocean and Cape May counties are projected to continue to have the highest proportion of elderly (aged 65 years and over) in the state. Bergen County will continue to have the most elderly residents.**

More than one in every five residents in Ocean and Cape May counties was aged 65 or over in 1996. This proportion of elderly is projected to continue to exceed 20 percent in these two counties throughout the projection period. In the state, the elderly are projected to account for 13.6 percent of the state's total population by 2006.

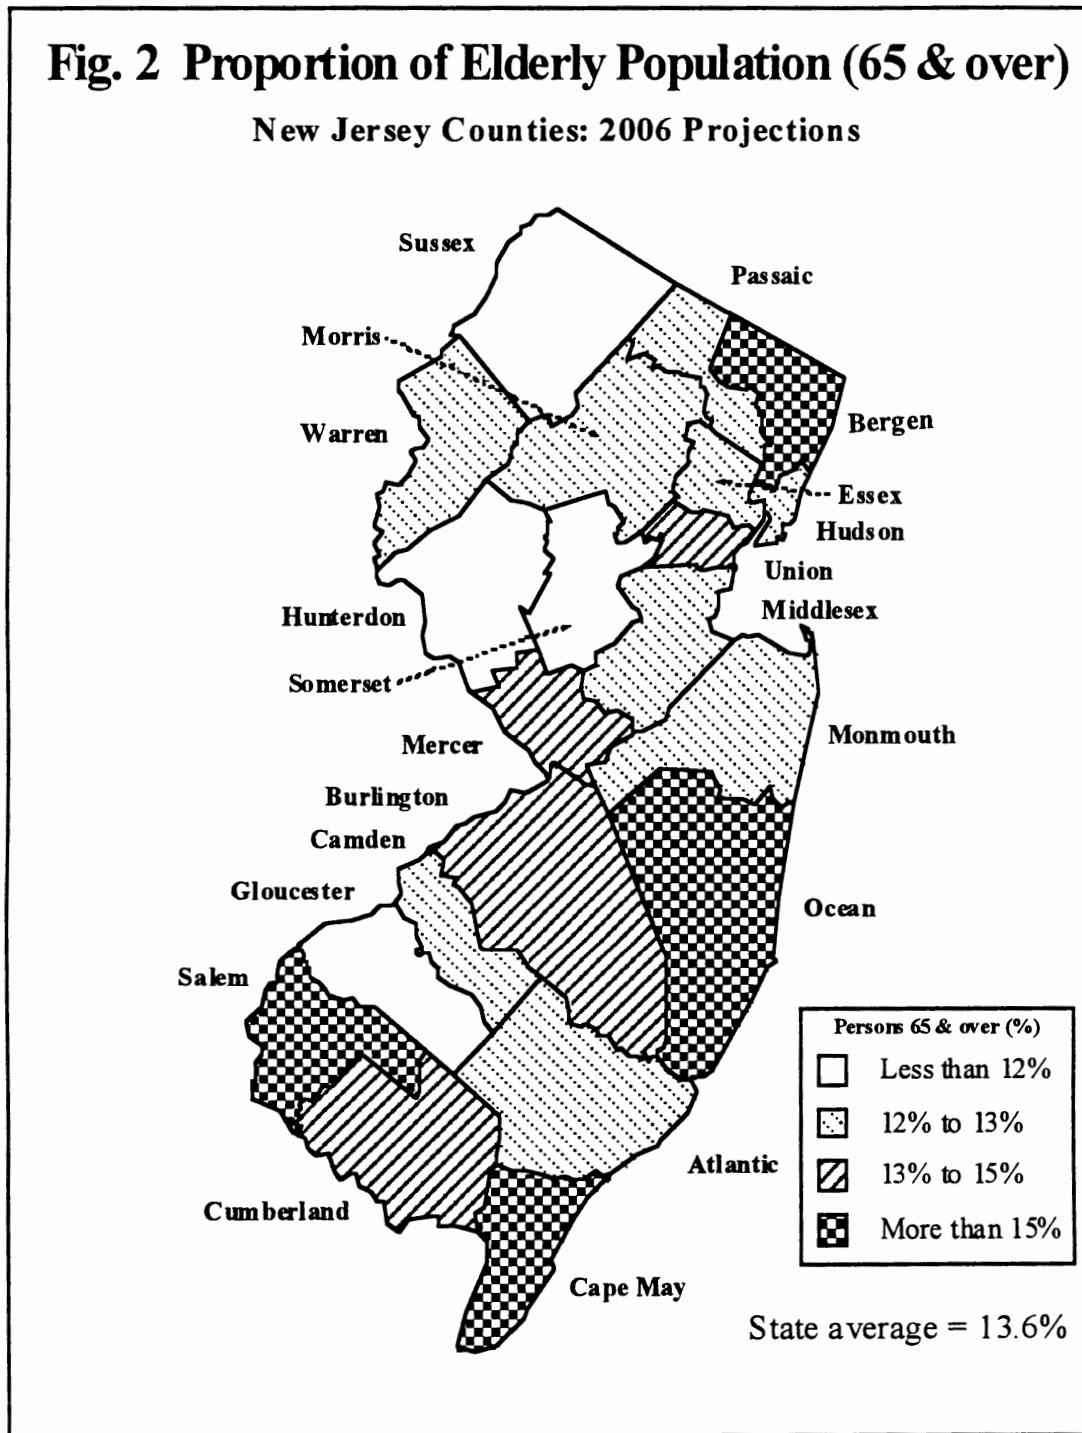

In contrast, Sussex (8.9%) and Hunterdon (9.4%) counties had the lowest proportion of persons 65 and over in the state in 1996. The proportion of elderly in these two counties is projected to remain less than 10 percent through 2006.

The number of Bergen County elderly residents was 134,800 in 1996 and will be 138,900 by

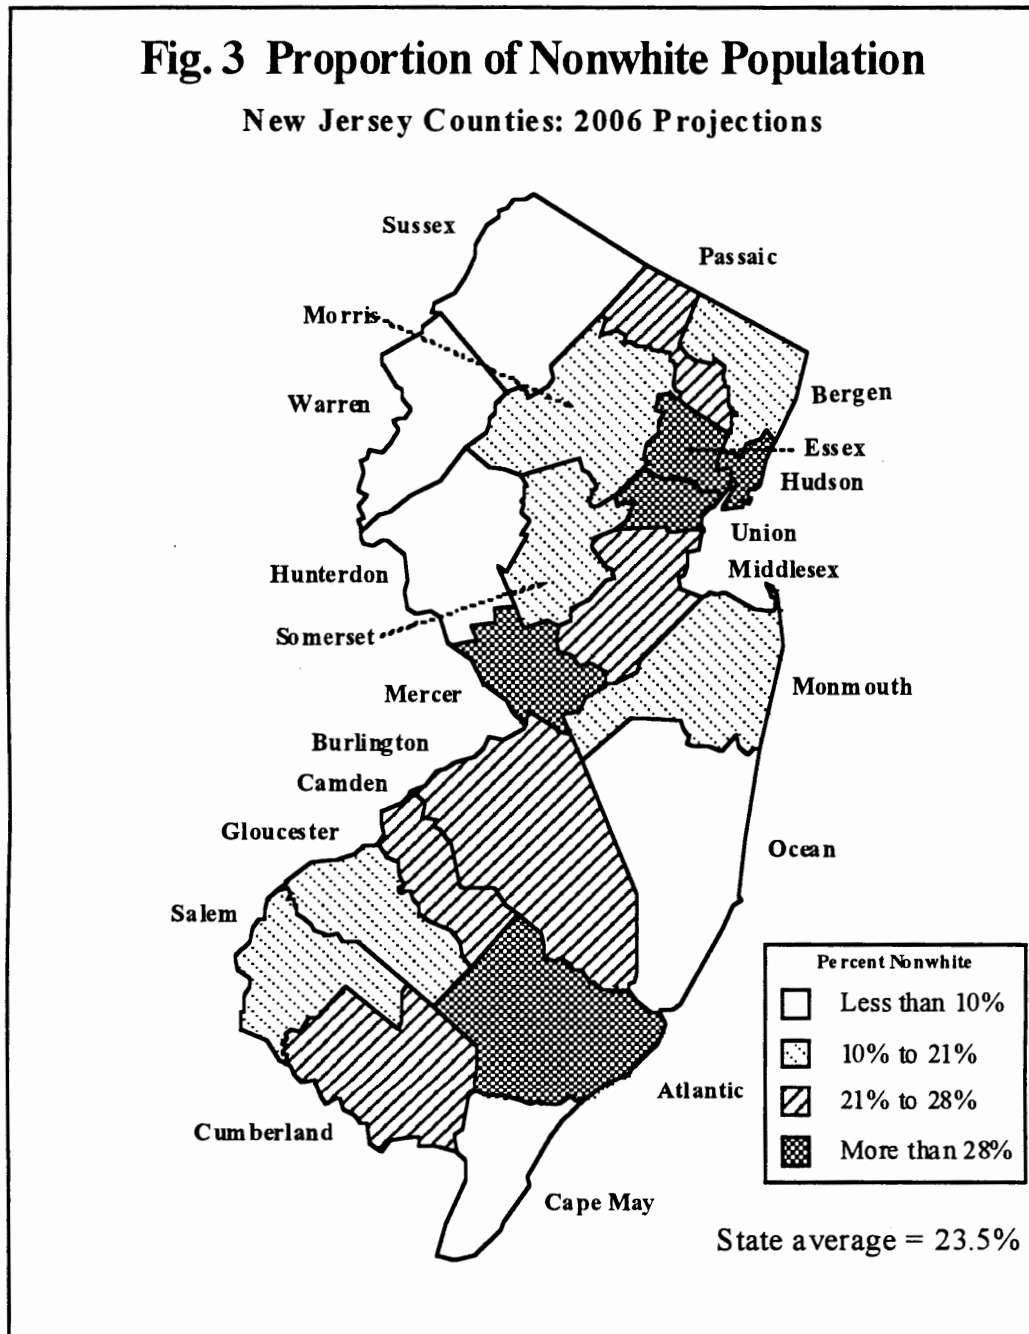

Table C. Proportion of Elderly  
(% of Persons 65 & over)  
in Selected Counties:  
1990, 1996 and 2006

County	1990	1996	2006
<b>New Jersey</b>	13.2	13.8	13.6
Ocean	23.1	23.1	22.6
Cape May	20.0	20.3	20.3
Hunterdon	9.4	9.9	9.6
Sussex	8.9	9.0	8.7

2006. Ocean is the only other county that will also have more than 100,000 elderly by 2006. Nearly 40 percent of the state's 65 and older residents are projected to inhabit four counties — Bergen, Ocean, Middlesex and Essex by the year 2006.

- Nonwhites are projected to account for an increasing share of each county's total population in the projection period. There will be more nonwhite than white residents in Essex County by the year 2006.

The population of both blacks and "other" races (Asian, Pacific Islander, American Indian, and Alaska Native) are projected to grow faster than their white counterpart in every county. Consequently, the shares of blacks and "other" races will increase throughout the projection period. In 1996, the proportion of blacks ranged from 1.1 percent in Sussex county to 42.8 percent in Essex

county. These proportions will increase to 1.2 percent and 45.2 percent, respectively, by 2006. At 9.6 percent in 1996, Middlesex County had the highest proportion of the "other" races population. By the year 2006, more than 15 percent of Middlesex county residents are projected to be "other" races.

Approximately 53.2 percent of Essex County residents were white in 1996. The percentage of whites in Essex County is projected to gradually decline to 49.0 percent by the year 2006.

Nonwhites were unevenly distributed among the state's 21 counties in 1996, and are projected to continue to be concentrated in a few counties. By 2006, Essex, Middlesex, Hudson and Bergen counties will have 46 percent of the state's total nonwhite population. Approximately one-half (50.2%) of the state's black population is projected to reside in Essex, Union, Camden and Passaic counties. Bergen, Middlesex, and Hudson counties are projected to have 46 percent of the state's "other" races population.

Table D. Proportion of Black Population  
In Selected Counties:  
1990, 1996 and 2006

County	1990	1996	2006
New Jersey	13.9%	14.5%	15.4%
Essex	41.4%	42.8%	45.2%
Mercer	19.2%	20.6%	22.7%
Union	19.1%	20.2%	21.9%
Hunterdon	2.1%	2.1%	2.1%
Warren	1.4%	1.7%	1.9%
Sussex	1.0%	1.1%	1.2%

Table E. Proportion of "Other" Races  
Population in Selected Counties:  
1990, 1996 and 2006

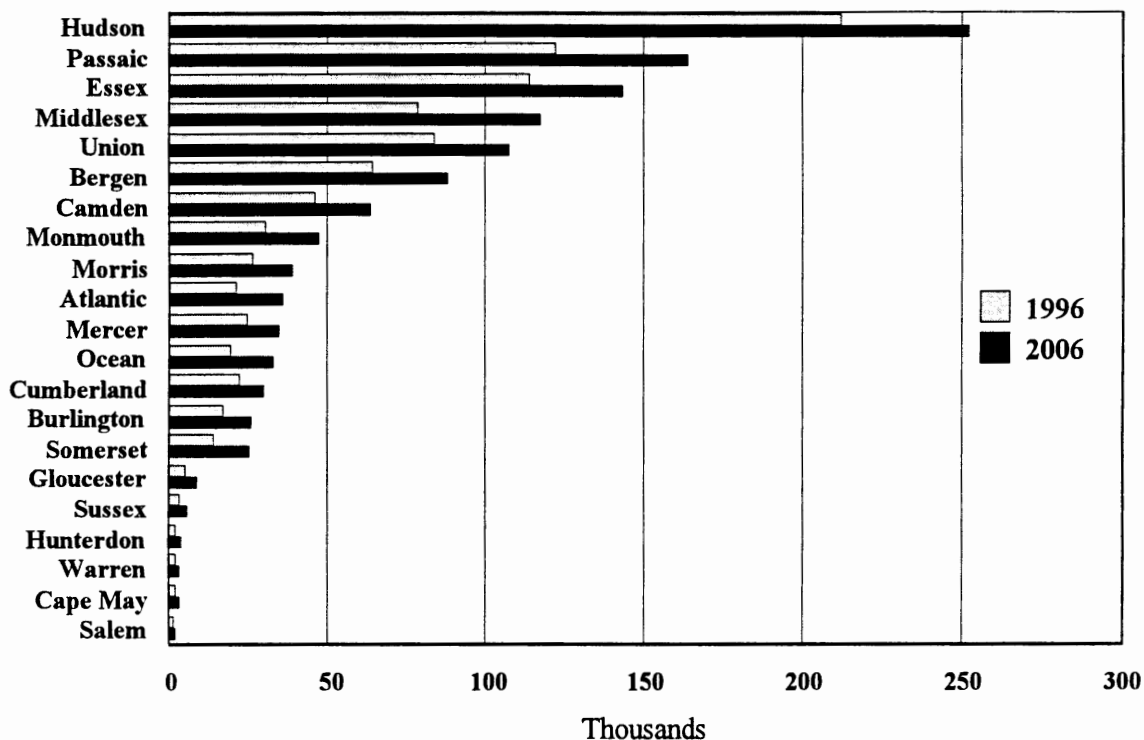

County	1990	1996	2006
New Jersey	3.8%	5.2%	8.2%
Middlesex	6.9%	9.6%	15.4%
Bergen	6.8%	9.6%	14.5%
Hudson	7.1%	9.2%	12.9%
Warren	0.9%	1.3%	2.4%
Cape May	0.9%	1.3%	2.2%
Salem	0.9%	1.3%	1.9%

- **Persons of Hispanic origin are projected to grow in all counties. By the year 2006, almost one-half (46%) of Hudson County residents will be Hispanic.**

The Hispanic population is projected to grow faster than its non-Hispanic counterpart in every county during the 1996-2006 period. Consequently, the proportion of Hispanics will increase in all counties from 1996 to 2006. In 1996, persons of Hispanic origin accounted for 38.7% and 25.5% of Hudson County and Passaic County's total population. These two counties are projected to continue to have the highest proportion of Hispanics (45.6% and 33.8%, respectively) by the year 2006.

More than 100,000 Hispanics resided in each of Hudson, Passaic and Essex counties. Together, these three counties accounted for 48.8% of the state's total Hispanic population in 1996.

**Figure 4.**  
**Hispanic Population by County:**  
**New Jersey, 1996 and 2006**

Two more counties – Middlesex and Union – are projected to have more than 100,000 Hispanics by the year 2006. These five counties as a group will account for 63.3% of New Jersey’s Hispanic population in 2006.

- **Total civilian labor force is projected to grow in all counties from 1996 to 2006. The labor force in the Coastal and Central counties will continue to grow faster than in the rest of the state.**

The state’s labor force is projected to grow faster from 1996 to 2006 than between 1990 and 1996, although slower than the pace in the 1980s. During the past decade, New Jersey experienced a substantial growth in civilian labor force due largely to the last of the "baby boomers" coming of working age. After the late 1980s, new entrants to the state’s labor force were drawn from the smaller "baby bust" and "baby boom echo" cohorts. The labor force growth in the projection period, however, will be more robust than in the early 1990s due at least partly to the recent economic recovery of the state.

Counties in the state's Coastal region (Atlantic, Cape May, Monmouth, Ocean) and Central region (Hunterdon, Mercer, Middlesex, Somerset) had substantial increases in labor force between 1990 and 1996. These counties are projected to continue to outpace the state in terms of labor force growth in the 1996-2006 projection period. Population growth in these counties is also projected to be faster than in the rest of the state. Mercer County will be the only county in this group to have a lower-than-average growth in labor force.

Table F. Labor Force Growth in Selected Counties:  
1990-1996 and 1996-2006

County	Labor Force Change (000)		Annual Growth Rate (%)	
	1990-96	1996-06	1990-96	1996-06
New Jersey	57.9	305.2	0.22%	0.71%
Somerset	13.6	31.3	1.48%	1.86%
Hunterdon	6.4	12.0	1.62%	1.67%
Gloucester	5.8	18.6	0.76%	1.41%
Hudson	-5.2	5.0	-0.29%	0.17%
Union	-8.3	.3	-0.50%	0.01%
Essex	-20.6	.5	-0.84%	0.01%

The urbanized Northeastern counties had a moderate decline in labor force between 1990 and 1996. The labor force in these counties are projected to increase slowly. Among these relatively slow-growing counties, Essex and Union will see virtually no change in their labor force from 1996 to 2006.

- **Females and nonwhites are projected to increase faster than their male and white counterparts in the labor force throughout the state. The shares of whites and males in the labor force are therefore projected to shrink in every county.**

The number of females in the labor force is projected to grow faster than males due to increasing female labor force participation and the somewhat declining rate of male labor force participation. The proportion of females in the labor force is projected to increase in all counties. In 1990, the proportion of females in the labor force ranged from 43.7 percent in Hunterdon County to 47.9 percent in Essex County. By 2006, the lowest and highest proportions of female labor force are projected to be 45.8 percent in Hunterdon County and 50.1 percent in Essex County.

Labor force participation of women had been risen rapidly in the 1970s and 1980s. However, there was a noticeable slowing in the rate of increase of women's labor force participation, particularly among younger women after 1989. The slower growth reflected in part that their participation rate had already reached a relatively high level. A continuation of relatively slower growth is thus projected for women in the state's labor force.

New Jersey has been a major locus of foreign immigrants in the nation. Foreign-born persons accounted for 12.5 percent of the state's total population according to the 1990 census. In addition, the state's foreign-born population is more diverse than any other states. These immigrants came from many different countries. However, most newcomers are Hispanic and Asian. The state experienced a net loss of population due to domestic (interstate) migration while receiving a large influx of foreign immigrants in recent years. This migration trend is expected to continue in the foreseeable future. The "other" races population and labor force are, therefore, projected to increase substantially in the state.

Table G. Annual Growth Rate of Female Labor Force in Selected Counties

County	1990-1996	1996-2006
<b>New Jersey</b>	0.7%	1.0%
Hunterdon	1.3%	2.4%
Sussex	0.3%	2.3%
Somerset	2.2%	1.8%
Mercer	0.3%	0.3%
Union	-0.1%	0.2%
Hudson	0.5%	0.1%

Table H. Proportion of Nonwhite Labor Force in Selected Counties

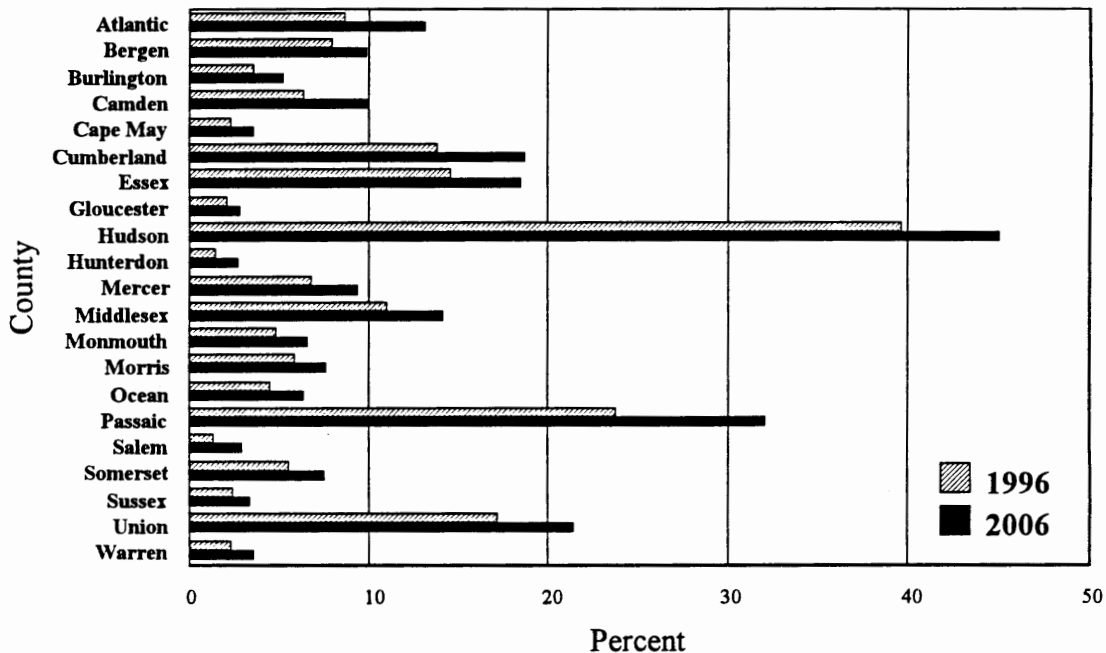

County	1996	2006
<b>New Jersey</b>	17.2%	21.4%
Essex	43.5%	48.6%
Hudson	21.9%	27.2%
Union	22.8%	26.5%
Mercer	21.5%	26.1%
Warren	2.8%	4.0%
Sussex	2.0%	3.3%

Parallel to the projected uneven population growth among racial groups, the nonwhite, especially the "other" races labor force is projected to grow considerably faster than its white counterpart. Between 1996 and 2006, the black and "other races" labor forces are projected to grow 1.3% and 6.5% per annum, respectively, while the white labor force will increase at a 0.2 percent yearly rate. As a result, nonwhites will account for an increasing share of the total civilian labor force in each county.

Similar to the projected concentration of nonwhites in the population, a difference in the number of nonwhites in the labor force among counties is also expected. In 1996, Essex County had the highest proportion of nonwhite labor force (43.5%) while Sussex County's 2.0 percent had the lowest proportion of nonwhite labor force in the state. These two counties are projected to continue to have the highest and lowest proportion of nonwhites in the labor force in 2006 — 48.6 percent and 3.3 percent, respectively.

- The growth of Hispanics in the labor force is projected to outpace non-Hispanic growth in every county. Hudson and Passaic counties will continue to have more Hispanics in the labor force than other counties in the state.

**Figure 5**  
**Proportion of Hispanic Labor Force by County**  
**New Jersey: 1996 and 2006**

Although varied among counties, the rate of Hispanic labor force growth is projected to be universally higher than its non-Hispanic counterpart in every New Jersey county from 1996 to 2006. The average growth rate will be 3.0% per annum in the state during the projection period. Consequently, the proportion of Hispanics in the labor force will increase in all counties. In 1990, the proportion of Hispanics ranged from 1.1% in Hunterdon County to 32.9% in Hudson County. These two counties are projected to continue to have the lowest (2.8%) and highest (45.1%) proportion of Hispanics in the labor force in New Jersey by the year 2006.

Hudson and Passaic counties had more Hispanics in the labor force (115,000 and 57,900 respectively) than other New Jersey counties as of 1996. These two counties are projected to continue to have the highest number of Hispanics in their labor force (133,000 and 81,100, respectively) by the year 2006. Together, they will account for more than one-third (34.4%) of the state's total Hispanic labor force.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race.

Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

Note: The "other races" and Hispanic populations in 1996 were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races", which includes Asian, Pacific Islander, American Indian and Alaska Native. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

*Atlantic County: Projections to July 1, 2000*

Age	All Races		White		Nonwhite	
	Male	Female	Male	Female	Male	Female
Total	66,100	60,400	52,500	45,800	13,600	14,500
16-24	9,300	9,500	7,000	7,100	2,200	2,400
25-34	15,400	13,100	11,400	9,300	4,000	3,800
35-44	18,400	16,200	15,100	12,300	3,400	3,900
45-54	13,500	13,400	11,200	10,700	2,300	2,700
55-64	6,700	6,200	5,500	4,900	1,200	1,300
65+	2,700	1,900	2,300	1,400	500	500

Note: The 1990 data were modified to be consistent with the 1990 Census modified age-race-sex (MARS) data. The "other races" and Hispanic labor force were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races" which include Asian, Pacific Islander, American Indian and Alaska Native. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

55-64	10,000	11,700	8,300	1,900	1,700	9,800
65+	2,500	4,000	2,200	400	300	3,600

***Burlington County: Projections to July 1, 2000***

Age	All Races		White		Nonwhite	
	Male	Female	Male	Female	Male	Female
Total	113,900	106,000	94,900	85,700	19,000	20,300
16-24	15,500	16,400	12,400	13,400	3,000	3,000
25-34	21,900	20,200	17,800	15,900	4,100	4,400
35-44	32,300	29,100	27,100	23,100	5,100	5,900
45-54	26,600	26,200	22,700	21,600	3,900	4,600
55-64	12,700	11,000	10,500	9,000	2,100	2,000
65+	4,900	3,200	4,300	2,700	700	500

Note: The 1990 data were modified to be consistent with the 1990 Census modified age-race-sex (MARS) data. The "other races" and Hispanic labor force were too small to produce reliable projections by age and sex. Nonwhite is the aggregate of black and "other races" which include Asian, Pacific Islander, American Indian and Alaska Native. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

## NEW JERSEY DEPARTMENT OF LABOR PROJECTIONS SYSTEM

### DEFINITION OF FLOWCHART TERMS

**Change Factors:** adjustments to industry staffing patterns which reflect the expected change in the occupational make-up of each industry due to changes in technology, business practices, etc.

**Commutation Ratios:** the ratio of nonfarm jobs in New Jersey to the number of employed residents.

**Headship Rates:** percentage of household population defined as “head of household.”

**Industry Employment Series:** non-farm wage and salary employment as defined in Volume 1.

**Industry/Occupation Matrix:** result of applying the OES staffing patterns (each industry’s estimated percent distribution by occupation) to the industry employment estimates.

**Labor Force Participation Rates:** percentage of the civilian, non-institutional, 16-and-older population that is in the labor force (see definitions in Volume 1).

**OES Survey:** see Volume 1.

**SEUF Factors:** ratios which reflect the estimated number of both self-employed and unpaid-family workers for each occupation, neither of which is included in either the industry employment or the OES survey estimates.

**Vital Statistics:** official resident birth and death records from the New Jersey Department of Health.

## APPENDIX 2

### DATA CONCEPTS AND RECONCILIATION

**Nonfarm Salary and Wage Employment:** The *industry* employment projections are for nonfarm wage and salary employment. This employment series measures jobs by place of business, is based on company or establishment payroll data and *excludes* farm employment, the self employed and unpaid family workers. This is the employment definition used in the Bureau of Labor Statistics' Current Employment Statistics (CES) program.

**Occupational Employment Estimates and Projections:** The occupational employment estimates and projections represent occupational employment by place of business. This employment series includes the nonfarm wage and salary employment defined above *plus* estimates of self-employed and unpaid family workers.

**Resident Employment:** Resident employment measures employed persons by place of residence (as opposed to place of work). Total resident employment includes nonfarm wage and salary employment, self-employed, unpaid family workers and total agricultural (farm) employment.

**Unemployed:** Persons who are not currently employed but are *actively seeking employment* and are available to accept jobs should they be offered one.

**Civilian Labor Force:** All civilians (persons who are not members of the Armed Forces and are not institutionalized) 16 years old and over who are employed or unemployed (as defined above).

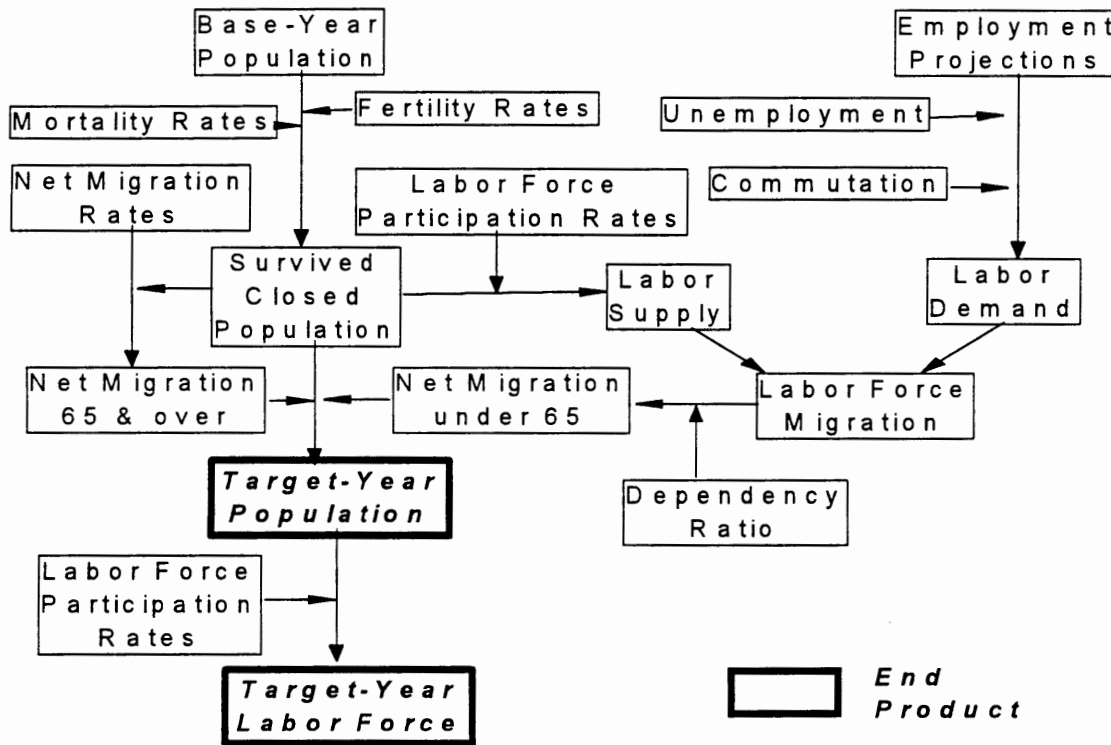

<b>Demographic and Economic Trends</b>

**APPENDIX 3**

**METHODOLOGY - THE PROJECTION MODEL**

The county-level population and labor force projections were prepared based on the *Economic-Demographic Model*. The *Economic-Demographic Model* used both economic and demographic inputs. Projections from this model are consistent with the year 2006 employment projections, which were published in Volume 1 of the Division's projections 2006 series.

**Population and Labor Force Projections  
Economic-Demographic Model**

The *Economic-Demographic Model* is based on standard demographic projection procedures, but assumes employment growth to be the major determinant of migration in and out of the state for persons under 65 years of age. The model is, therefore, driven primarily by labor demand, which is estimated based on the 2006 employment projections prepared by this Division.

**The Cohort-Component Method**

The basic projection procedure used in this model is known as the *cohort-component method*. For

each five-year cycle of the projection, a base population distribution by age, race and sex is "aged" five years. Each five-year age group is reduced through a survival ratio to account for mortality during the five years. Births are computed by applying five-year age-race-sex-specific fertility rates to the female age groups from 10 to 49. After adjustment for mortality through a survival ratio, the five years of births become the projected group 0 to 4 years of age. Net migrants are added to the resulting projected population by age, race and sex. This procedure is repeated for each five-year interval in the projection period. Specific inputs and their methods of development are discussed separately below.

### **Base Population**

The base population used in the projection is the July 1, 1996 estimates by age, race and sex. Age is defined by five-year groups from age 0 to age 84, with an open category for age 85 and over. The 1996 county population estimates by age, race, sex and Hispanic origin were prepared by the US Bureau of the Census in August 1998.

According to the US Bureau of the Census, there was an age-reporting problem in the 1990 census. As a result, the age of approximately 26% of the persons under one year old was mis-reported in New Jersey. In addition, 275,407 persons in New Jersey were enumerated as *other (not specified) races* in the 1990 census. These people were not included in any of the 15 racial categories listed on the census form but were included in all race-related tabulations. In order to meet the needs of many users of census data, the race statistics were modified to be consistent with the classification used in data sets other than the census, and the age data were adjusted to correspond with the April 1, 1990 census date. The "modified" data were released by the Census Bureau as the 1990 census MARS (Modified Age-Race-Sex) files and were used in preparing the national population and labor force projections. The background and procedures for the age and race modifications were described in Appendix 4 (pages 173-175). For comparison purposes, Appendix 4 also includes the original (unmodified) 1990 Census population counts by age, race, sex and Hispanic origin for each county (pages 176-196).

The age-race-sex distribution of the county population prepared by the Census Bureau is consistent with the 1990 census MARS data and includes estimated changes from 1990 to 1996. Thus, the base population reflects the demographic characteristics of the latest decennial census and the recent trend.

### **Fertility and Mortality**

Age-specific fertility rates by race and Hispanic origin were used to compute births to women in each five-year interval. The fertility trend was determined from the national "middle series" projections of fertility by age, race and Hispanic origin of mother. Rates for each county were adjusted to reflect the relationship of the county rates to the national rates in the 1990-96 period. In the national projections, very little change from the recent "high" fertility level is projected, and no convergence of rates among races is assumed<sup>1</sup>. Based on the national trend, New Jersey's total fertility rates are projected to change very slowly from 1.9 births per woman in 1996 to 1.8 births by 2006.

---

<sup>1</sup> According to the US Census Bureau, after a relatively stable 15-year trend of low fertility, there has been a substantial rise in total fertility levels to almost 2.1 births per woman since the late 1980s. The current national projections assumed that the current fertility level would remain virtually unchanged until 2010 due to the influx of young foreign immigrants. The convergence of fertility among race groups is no longer assumed in the newly revised projections because there is little evidence to support the convergence assumption.

Similar reasoning was used in the projection of mortality. State survival ratios by age, race, sex and Hispanic origin were projected on the basis of the US Census Bureau's "middle mortality assumption" for the nation, and incorporating the recent mortality differences between New Jersey and the nation. Mortality rates for both the nation and the state are projected to decline gradually. (The source of the state's births and deaths data is the New Jersey Department of Health and Senior Services.) The projected statewide mortality rates were applied to individual counties in the projection since there are virtually no variations of mortality rates among counties.

### **Migration of Persons Under 65 Years of Age**

Projected migration of persons of working age and children is based on the projected civilian labor market and constitutes the assumption that distinguishes this model from purely demographic models. In simple terms, an over-supply of labor relative to demand for workers results in a net out-flow of persons from the state while high demand relative to supply results in a net in-flow of migrants. Net migration is, therefore, based on the size of the civilian labor force needed to balance the labor market.

Labor supply is estimated by applying projected labor force participation rates to civilian persons 16 years of age and over in the population projected without migration (i.e., the "survived closed population"). These rates are based on national labor force projections by age, race, sex and Hispanic origin produced by the US Bureau of Labor Statistics until 2006. The increase/decrease pattern for each age-race-sex group projected between 1996-2006 is assumed to continue after 2006, but at a slower pace. The differences in participation rates between the nation and individual counties are carried over throughout the projection period.

Labor demand is determined by employment projections adjusted to a residence basis and the projections of unemployment rates. Employment projections reflect the historical growth of industries in the state and the projected growth by industry at the national level (published by the US Bureau of Labor Statistics). Population from the preliminary *Economic-Demographic* projections were also input to the 2006 employment projections for selected industries. The state's recent strong economic recovery is assumed to continue through the rest of the century. Employment is therefore projected to grow at a slower rate from 2000 to 2006 than during the 1996-2000 period. Between 2006 and 2010, the state and individual counties' employment growth rates are assumed to be the same as the 1996-2006 average rate. Adjustment of employment to a residence basis is necessary due to commutation across state boundaries, self-employment, and multiple-job holdings.

Finally, net migration of the labor force is determined by the balance of demand and supply, allowing a level of unemployment projected for individual counties. The resulting labor force net migrants are inflated to include children and adults under 64 years old who are not in the labor force and are distributed by age, race, sex and Hispanic origin according to the projected labor force participation rates and migration patterns observed in the 1990-1996 period.

### **Migration of Persons 65 Years of Age and Older**

Migration patterns of persons 65 years of age and over are assumed to follow their migration patterns estimated based on the 1990-1996 data. Rates by age, race, sex and Hispanic origin were inferred from the five-year change in birth cohorts, and by an adjustment to the 1990-1996 annual estimates of the population 65 and over by age, race, sex and Hispanic origin prepared by the US Bureau of the Census.

## CIVILIAN LABOR FORCE PROJECTIONS

Projected civilian labor force is obtained by applying the projected age-race-sex-origin specific labor force participation rates to the civilian population aged 16 and over derived from the *Economic-Demographic Model*. The non-civilian population in New Jersey is assumed to be constant at its 1996 level through the projection period. The projections of total population and labor force participation rates were discussed in the previous sections of this report. Definitions of labor force and participation rates in this report follow that of the decennial census, which differ slightly from those used in the US Bureau of Labor Statistics' (BLS) publications. Numbers published by BLS are based on annual averages computed from monthly sample surveys (i.e., *Current Population Survey*), which were taken by trained interviewers while census data were reported by individual respondents and cover all civilian population.<sup>2</sup>

---

<sup>2</sup> Beginning from January 1996, the labor force estimates are generated from BLS-developed statistical models due to a sample reduction in the *Current Population Survey* (CPS). However, the CPS survey result still is a major input to the statistical model.

## APPENDIX 4

### 1990 CENSUS RACE AND AGE MODIFICATION

---

Source: US Bureau of the Census: 1990 CPH-L-74 : *Age, Sex, Race and Hispanic Origin Information from the 1990 Census: a Comparison of Census Results with Results Where Age and Race Have Been Modified.*

---

Essentially the race statistics were modified to be consistent with the classification used in data sets other than the census, while the age data were adjusted to correspond with the April 1, 1990 census date.

**These "modified" data are consistent with the counts of the 1990 census as enumerated, which do not include any adjustments for census undercount or overcount.**

#### RACE MODIFICATION

There were 9,804,847 *other race* persons included in the 1990 census. These people were not included in one of the 15 racial categories listed on the census form. The existence of this group is inconsistent with the race categories defined by the Office of Management and Budget in *OMB Directive 15*. Such "non-specified" race persons also are not found in data sources other than the census. In order to serve the needs of some portions of the user community, it is necessary to assign each of these persons to a specified race.

After evaluating many alternatives, the following race assignment rule was used: Assign each *other race* person to the specified race reported by a nearby person with an identical response to the Hispanic origin question. The only alternative specifications which yielded significantly different national results were those where responses to the Hispanic origin question were ignored during the assignment of race. This work was done separately for each of the 449 district offices.

#### Background Information on the Race Assignment Rule

1. The specific Hispanic origin of each *other race* person in the 1990 census was taken into account when assigning them to a specified race. This was considered appropriate because over 95 percent of the *other race* persons were of Hispanic origin. Their origin response was used, whether or not it had been allocated, in order to preserve the race distribution within each type of origin. The specific Hispanic origin responses were "not Spanish/Hispanic, Mexican, Puerto Rican, Cuban, and other Spanish/Hispanic".

2. Virtually every person who reported both a specified race and an origin was included in the "donor pool" of eligible persons. The sole exception was the exclusion of several non-specific American Indian codes from the donor pool since: 1) preliminary 1990 research suggested questionable reporting in the American Indian category and; 2) previous research showed that a high proportion of such persons were much less likely to be American Indians than those who actually provided a specific tribe response as instructed on the census form. These codes were: 548--Amerind White, 549--Amerind Black, 597--American Indian (no tribe reported), 598--American Indian (tribal responses not elsewhere classified), and 973--FOSDIC circle with no write-in response. These were excluded because of evidence from the 1980 census that misreporting of race was much higher in these codes than it was in codes representing specific American Indian tribes.

Consistent with advisory committee recommendations, any person assigned to the American Indian race through allocation was given code 973 rather than a specific tribal code.

3. The assignment of a specified race was made on an individual basis. That is, no effort was made to minimize racial heterogeneity within households. Any such attempt would have made it difficult to assign race in a manner which approximated the specified-race distribution reported by persons with the same Hispanic origin response.

4. The race, origin, or sex of some persons also changed as a result of the assignment of a different age to them during the application of the age modification procedures. Their changed age sometimes caused the person to be allocated a different relationship and/or sex, which resulted in the person receiving their race or origin from a different person in the household (since those items were allocated according to a hierarchy of relationships).

5. The results of the race modification procedures were overridden in four counties where the American Indian population grew by more than 100 percent and also became at least one percentage point more of the county's population: Adams County, Washington; Harmon County, Oklahoma; Clark County, Idaho; and Washington County, Idaho. In each case the persons were made white.

6. In most census allocation procedures, acceptable data from eligible persons (donors) are far more common than are the cases where the value is assigned to persons without the characteristic (the donees). This means information from any given donor is rarely used more than once. However, such large donor-to-donee ratios were not usual here. There were a number of occasions where those needing a specified race outnumbered those who reported the same origin as well as a specified race.

Special procedures were adopted to minimize the distortions produced by such low ratios of donors to donees in some cells of these matrices. The most important change was to expand each cell of every allocation matrix to hold 64 values, rather than the 8 stored in most 1990 census matrices. For each district office, the initial race data were then obtained by running the actual census file and storing up to the first 64 acceptable cases in each data cell. If the district office did not have 64 cases, the remaining values were assumed to be white. After the matrices were so "warmed," the program went back to the beginning of the data and began the race assignments. The actual race assignment was a random selection from the unused values within each cell. If all 64 values had been used, then assignment was random from among all 64 until new acceptable cases were available. Used values in a cell were replaced with acceptable data in reverse of the order of use.

## AGE MODIFICATION

The following is a portion of the text of a user note which is incorporated in 1990 census products. It explains why the data were modified.

Age Reporting--Review of detailed 1990 information indicated that respondents tended to provide their age as of the date of completion of the questionnaire, not their age as of April 1, 1990. In addition, there may have been a tendency for respondents to round up their age if they were close to having a birthday. It is likely that approximately 10 percent of persons in most age groups are actually 1 year younger. For most single years of age, the misstatements are largely offsetting. The problem is most pronounced at age 0 because persons lost to age 1 may not have been fully offset by the inclusion of babies born after April 1, 1990 and because there may have been more rounding up to age 1 to avoid reporting age as 0 years. (Age in completed months was not collected for infants under age 1.)

The reporting of age 1 year older than age on April 1, 1990 is likely to have been greater in areas where the census data were collected later in 1990.

About 95 percent of the population provided acceptable birth year responses which were adjusted with the following procedures. The age data for individuals in households were modified by adjusting the reported birth year data by race and sex for each of the 1990 Census' 449 district offices to correspond with the national level quarterly distribution of births available from the National Center for Health Statistics. The data for persons in group quarters were adjusted on a state basis to minimize the number of matrix cells with very small numbers. The central assumption in this procedure is that there is no reason for the residents of any subnational area to have a different quarter of birth distribution from that found at the national level. It was also assumed that there are no significant birth place-sex-race-origin differences in annual birth distributions by quarter, that all those born before 1920 have the same quarter of birth distribution, and that mortality is not selective by quarter of birth. Approximately 100 million persons have an age in this modified file which is one year different from that they had in the 1990 census.

The modification procedure was done separately for each birth year, by sex, for the white; black; Asian or Pacific Islander; and American Indian, Eskimo, or Aleut populations. For every birth year the program was provided with the number of cases out of 10,000 where the birth year plus the person's age should equal 1989 (most years that number was close to 7,500). These overall control values were calculated from the available monthly birth statistics for the 1920 to 1989 period. Earlier birth years were each assumed to have the same seasonal pattern as was exhibited by the unweighted average of the 1920-24 birth cohorts. Each sex-race-origin cell was next randomly assigned a value of 0, 0.25, 0.5, or 0.75. Then, each time that birth year cell was encountered, a test was made to see if that birth year plus the person's age should equal 1989 or 1990. The choice of an age was dependent on whether its acceptance moved the cell's actual population distribution toward the control value distribution.

#### MODIFIED AGE-RACE-SEX (MARS) DATA

The April 1, 1990 population by age, race and sex presented in Tables 2-4 are the MARS data. For comparison purpose, the 1990 census enumerated counts (unmodified) by age-race-sex are displayed on subsequent pages.
