TRENTON, N. J., June 30th, 1919.

To His Excellency, William N. Runyon, Governor of New Jersey:

SIR—In accordance with Chapter 288 of the Laws of 1915, I have the honor to transmit herewith the Forty-second Annual Report of the Department of Health of the State of New Jersey.

Very respectfully,

J. C. PRICE,
Director.

Report of the Director

J. C. PRICE, M.D., DIRECTOR.

An Act of the Legislature approved February 27th, 1918, changed the beginning of the fiscal year from November 1st to July 1st. In consequence of this change this volume contains a report on the activities of the Department of Health from July 1st, 1918, to June 30th, 1919, and also embraces the reports of the several bureaus for the preceding eight months, November 1st, 1917, to June 30th, 1918. Since the publication of the last annual report of this Department an additional bureau has been organized, namely, the Bureau of Venereal Disease Control. The Division of Child Hygiene, formerly a part of the Bureau of Publicity and Education, has been reorganized and a separate bureau created. The Department has been exceedingly fortunate in securing as Chief of this Bureau Dr. Julius Levy, acting in the capacity of Consultant and Supervising Expert. The Legislature of 1919 appropriated for the use of this Bureau the sum of \$125,000.00. This amount became available on July 1st, 1919, and is the largest ever received for any single bureau of this Department. It will be expended for the conservation of child life throughout New Jersey. The activities of this important undertaking will be extended to the most remote districts of the state. The work of this Bureau is divided into four divisions, the Division of Consultation and Nursing, the Division of Midwifery, the Division of Children's Institutions and Boarding out Babies, and the Division of Education and Extension. Each succeeding year brings added interest in the Child Welfare work. The death rate among young children is largest where poverty and ignorance prevail. These conditions are found frequently within industrial centers, where mothers are under-paid and over-

worked, compelled to leave their homes in order to gain sufficient sustenance to support a growing family. Such a condition is not creditable to our civilization, that 300,000 babies die annually in the United States from diseases fifty per cent of which are absolutely preventable. As the years roll round, however, the baby is coming to its own, and we feel sure that at no distant day the so-called advanced civilization and higher standards of living attained in every municipality will be largely gauged by the size of its infant death rate.

The Sixty-fifth Congress, second session, passed an Act appropriating \$1,000,000.00 to be paid to the states for the use of their respective health departments in the prevention, control and treatment of venereal diseases, to be so conditioned that for each dollar paid to any state the state shall appropriate an equal amount for the purposes above stated. New Jersey was one of the first states offering to co-operate with the Federal Government, and a Bureau for the Control of Venereal Disease was at once organized. It is the purpose of this Bureau to co-operate with the medical profession, the military authorities and the public and to exercise supervision over all activities throughout the entire state. A campaign of education and publicity is in active operation. Clinics have been established in ten of the principal cities of this commonwealth, and more than 9,000 patients have received treatment. Lectures were given before medical societies and at industrial plants, and many thousand pamphlets printed in foreign languages have been distributed. Literature has been sent to every state in the union, and distributed among doctors, ministers, principals of schools, health officers, mayors, and township authorities. The work already begun by this bureau, and so efficiently carried forward by Dr. J. Holmes Smith, Chief of the Bureau of Venereal Disease Control, will be pushed with vigor, with a determined resolution that the scourge undermining the constitution and impairing the mentality of our youth may be blotted out. The great underlying and fundamental factor of national prosperity and national advance is in the strength and vigor of our people.

Notwithstanding the fact that there was a decrease in the number of marriages in New Jersey exceeding 6,000 for the fiscal year 1918, due to so large a number of our young men on the firing line in France, the activities of this Bureau were vastly increased as a result of the war. The number of deaths in 1918 exceeded those for the preceding year by more than 17,000, as a result of the epidemic of Spanish influenza which assumed vast proportions throughout the state. The total number of certificates received, all kinds, reached 162,915, an increase of more than 10,000 over the previous year. The fees of the Bureau were materially increased though no charge was exacted for certificates for soldiers, sailors or war workers. The Bureau has recently forwarded to each of the 500 registrars in New Jersey a letter requesting that hereafter an engraved birth certificate be forwarded to the parents of each new born child. More than 100

DIRECTOR'S REPORT.

3

municipalities have already complied with this request, and it is believed that at no distant day every child born within this commonwealth will receive a suitable testimonial and record of birth. Through a recent act of the Legislature this Bureau was authorized to issue free of charge certificates of birth to those desiring employment.

There is probably no state in the Continental Union of the approximate area and population of New Jersey that produces so great a quantity of milk. Besides supplying our three million inhabitants vast quantities are shipped to New York and Philadelphia. In consequence of this fact the major portion of money supplied to this Bureau of Food and Drugs is used to maintain a safe, pure and sanitary milk supply. Our inspectors are traveling over the state constantly procuring samples from producers and dealers whose products are suspected of not conforming to the state statutes. Our veterinarian is daily examining the herds from which raw milk is sold. These herds are subjected frequently to the tuberculin test and reactors destroyed.

This Bureau has supervision over all creameries, pasteurizing plants, cold storage warehouses and slaughter houses. Frequent inspections are made and if operated in compliance with our rules and regulations, and surroundings found in a sanitary condition, they are licensed by this Department.

Canning factory investigations were carried on in co-operation with the Bureau of Chemistry of the United States Department of Agriculture and during the war licensed by the Federal Food Administration. For violations of this law hearings were given and canners warned that the continued use of decomposed material in the preparation of food products would result in the revocation of the license.

The misbranding of proprietary medicines has received the attention of this Bureau. The literature and labels used in the sale were in several instances found to be false and misleading. Investigations were made, hearings given, and the parties warned of violations. Further investigations demonstrated that the articles spoken of were prepared in a manner and the labels so worded as to comply with the law.

One of the larger industries in New Jersey is the growing and shipping of oysters. The sales from this important food product reach a sum annually approximating four million dollars. In consequence of the rapid growth of the state great care is exercised by this Department to prevent the waters of the oyster producing areas from being polluted. New Jersey has many thousand acres of riparian lands, more than 30,000 acres are leased to oystermen. This delicious food product is susceptible of contamination and in order to guard against pollution the inspection boat of this Department is in commission during the spring, summer and fall months patrolling the waters and guarding the beds from infection. This boat is provided with a laboratory and a bacteriologist in charge. Analyses are made both of the oysters and the water in which they are grown. These

efforts by this Department should insure a safe product and one fit for human consumption.

The eastern coast of New Jersey is washed with ocean tides. Many of the great ports of entry and magnificent harbors of the Atlantic are easily accessible. This favorable location for transportation overseas made New Jersey the center for many war activities. More than a score of military agencies were established within the confines of this state. One of the largest military reservations, Camp Dix, is located in Burlington county, and on several occasions during the war more than 75,000 soldiers were quartered there for purposes of equipment and drilling. The Department of Health, in an advisory capacity, co-operated with the Federal Government in establishing an efficient system of water supply and sewage disposal. Appreciating the obligation due our military forces in civilian territory accessible to soldiers, this Department, in co-operation with the Public Health Service and the American Red Cross established an extra cantonment zone surrounding the entire reservation five miles in width and embracing an area of more than one hundred fifty square miles, in which were ten separate municipalities. The Department established a branch office within this extra cantonment of which the Chief of the Bureau of Local Health Administration was made Director in September, 1917, and the work of improving sanitary conditions throughout this entire zone was immediately begun, with the determination to protect the health of the soldier and the civilian. The scope of this work involved efficient control of communicable diseases, proper disposal of human excrement, supervision over food, milk and water supplies, and the elimination of breeding places for mosquitoes and flies. Insanitary eating places were driven out of business, and those that complied with established rules and regulations were licensed. Similar activities, with sanitary surveys, were rendered at Camp Merritt, Camp Raritan, and the Naval Rifle Range at Great Piece Meadows. One of the most difficult problems to solve in these various districts was the abolishment of insanitary privies, and the proper disposal of sewage and household waste. Local Boards of Health were called together and ordinances passed requiring flyproof toilets with watertight vaults. Schools were inspected, children vaccinated, and the parents instructed in rural sanitation.

The nationwide epidemic of influenza spread through New Jersey in the early fall of 1918. No city, town or hamlet escaped its ravages. The hillsides of every community were dotted with newly made graves, and the records of this Department registered approximately 300,000 cases. All this happened notwithstanding the vigorous efforts of the Department to check the disease in its incipency. The public was instructed to avoid crowds, all public gatherings were forbidden, schools, churches, theatres, moving picture shows and saloons were ordered closed, yet the disease spread. Its limits were boundless, reaching from ocean to ocean, from the Great Lakes to the Gulf, and at the present time making vast inroads in Alaska and the Philippine Islands.

DIRECTOR'S REPORT.

5

SEWERAGE WORKS, PLANS FOR WHICH HAVE BEEN ACTED UPON BY THE DEPARTMENT OR THE WORKS CONSTRUCTED.

The plans for sewer extensions approved by the Department have been for the following municipalities: Collingswood (4), Flemington, Garwood (2), Haskell—E. I. du Pont de Nemours & Company—(2), Linden Township (3), Long Branch (3), Madison, Manasquan, Merchantville, Milltown, Morristown, Palisades Park, Red Bank, South Orange Township, Summit, Westfield.

Sewer extensions were approved with conditional stipulations, as follows:

BOUND BROOK (2):—Subject to the order issued by the Department to the authorities of the municipality of Bound Brook to discontinue discharging raw sewage into the Raritan river.

CARNEY'S POINT (5) (E. I. du Pont de Nemours & Company):—Subject to the construction of a sewage treatment plant at such time as this Department may require.

HACKENSACK:—That such approval shall not in any manner affect the force or terms of an order by this Department requiring this municipality to cease polluting the waters of this state.

LINDEN TOWNSHIP (Grasselli Chemical Company):—Subject to the construction of a sewage treatment plant at such time as this Department may require.

PHILLIPSEURG:—That a sewage treatment plant be constructed as required by this Department.

RAHWAY:—That such approval will not in any manner affect the force or terms of an order by this Department, requiring this municipality to cease polluting the waters of this state.

TRENTON (5):—That a sewage treatment plant be constructed as required by this Department.

UPPER PENN'S NECK TOWNSHIP (E. I. du Pont de Nemours & Company):—Subject to the construction of a sewage treatment plant at such time as this Department may require.

AT THE FOLLOWING PLACES PLANS FOR SEWAGE TREATMENT PLANTS HAVE BEEN APPROVED.

ASYLA (Camden County Institutions):—Plans were approved on March 19th, 1918, for alterations to the present sewage treatment plant. The approved plans call for the construction of a sprinkling filter, 12 feet in width, 200 feet in length, and 5½ feet in depth.

ALLENWOOD (Monmouth County Tuberculosis Hospital):—On May 28th, 1918, plans were approved for a sedimentation tank, 4 feet in width, 12 feet in length, and 4 feet in depth; a dosing tank, with a capacity of 500 gallons; two sub-surface irrigation fields, each field to contain 975 feet of 3-inch farm tile.

FLEMINGTON (New Jersey Cider Vinegar Company):—On March 10th, 1919, plans were approved for the preliminary treatment of industrial wastes. The plant is to consist of a screen chamber, 5 feet in width, 5 feet in length, and 4 feet in depth; screens are of ¼-inch mesh; and a settling tank, 5 feet in width, 15 feet in length, and 4 feet in depth. The effluent is to be discharged into the sewerage system of Flemington.

MORRISTOWN:—On July 23d, 1918, plans were approved for three additional sand filtration beds, with a total area of .38 acres. A variable flow chlorinator has been installed.

PALMYRA:—Plans were approved May 13th, 1919, for a sanitary sewer system and sewage treatment plant. The plant is to consist of a two-story sedimentation tank, the capacity of the settling chamber is to be 40,000 gallons; and a sludge drying bed, 1,000 square feet in area. The effluent will discharge into the Delaware river. The plans were approved with the proviso, that additional purification processes will be constructed when required by this Department.

PAULSBORO:—Plans were approved February 19th, 1918, for a sanitary sewer system and a sewage treatment plant. The plant is to consist of the following units: A two-story sedimentation tank, 25 feet in width, 50 feet in length, and 12 feet in depth; two sludge drying beds, each 900 square feet in area. The effluent will discharge into Mantua creek.

PAULSBORO (American Standard Metal Products Company):—Plans were approved March 5th, 1918, for alterations to the three sand filtration beds and for a two-story settling tank, 9 feet in width, 14 feet in length, and 8 feet in depth.

PEMBERTON (Pemberton Township Water, Sewerage and Light Company):—On April 2d, 1918, plans were approved for improvements to the sewage treatment plant.

PRINCETON:—On November 13th, 1917, plans were approved for two additional sand filtration beds, each 84 feet by 84 feet, and 3½ feet in depth, at the northeast sewage treatment plant.

PROSPECT PARK:—On November 13th, 1917, plans were approved for a sanitary sewer system. The effluent will discharge into the Passaic Valley Trunk Sewer.

RAHWAY (Philadelphia Quartz Company):—On May 6th, 1919, plans were approved for a sewage treatment plant consisting of the following units: A one-story sedimentation tank of two compartments, each compartment is 4 feet in width, 9 feet in length, and 6 feet in depth; a dosing tank, with a capacity of 650 gallons; and two sand filtration beds, each 900 square feet in area. The effluent will discharge into the Rahway river.

ROCKAWAY VALLEY TRUNK SEWER:—On April 9th, 1918, plans were approved with provisos for an intercepting sewer and sewage treatment plant to receive the sewage from the municipalities located upon the Jersey City watershed. The approved plans call for the construction of two-story sedimentation tanks, units for the activated sludge treatment, and chlorine disinfection. The effluent will discharge into the Rockaway river.

SEA ISLE CITY:—Plans were approved July 30th, 1918, for the installation of a solution feed chlorinator.

SUSSEX:—Plans were approved May 7th, 1918, for a two-story sedimentation tank, 18 feet in diameter and 27 feet in depth; a solution feed chlorinator; a contact retention tank, 10 feet in width, 12 feet in length, and 6½ feet in depth; and a sludge drying bed 660 square feet in area. Effluent will discharge into Papakating creek.

WESFIELD:—Plans were approved April 2d, 1918, for improvements to the sewage treatment plant.

WESTMONT:—On May 13th, 1919, plans were approved for a sanitary sewer system in a part of this municipality and a sewage treatment plant consisting of the following units: A two-story sedimentation tank, 20 feet in width, 36 feet in length, and 24 feet in depth; a dosing tank with a capacity of 5,000 gallons; a sprinkling filter with an area of .088 acres and a depth of 5½ feet; a secondary settling tank, 16 feet in width, 30 feet in length, and 3 feet in depth; and a sludge drying bed, 1,100 square feet in area. The effluent will discharge into Cooper river.

DIRECTOR'S REPORT.

7

WESTMONT-HADDONFIELD (Joint Project):—Plans were approved May 13th, 1919, for a sanitary sewer system and a sewage treatment plant consisting of the following units: A two-story sedimentation tank, the capacity of the settling chamber is 13,500 gallons, the capacity of the sludge chamber is 75 cubic yards; a sprinkling filter with an area of .088 acres and a depth of 5½ feet; a secondary settling tank with a capacity of 9,000 gallons; and a sludge drying bed, 1,120 square feet in area. The effluent will discharge into Newton creek. The plans were approved with the proviso that the municipality of Haddonfield shall improve its present sewage treatment plant in accordance with the plans approved on October 2d, 1917, before construction begins upon this project.

WOODBURY:—On April 2d, 1918, plans were approved for a sanitary sewer system.

AT THE FOLLOWING PLACES PLANS FOR SEWAGE TREATMENT PLANTS HAVE BEEN DISAPPROVED.

CALDWELL TOWNSHIP:—On January 14th, 1919, plans for a sewage treatment plant at the rifle range on the Great Piece Meadows were disapproved.

MAYS LANDING (Bethlehem Loading Company):—On March 7th, 1918, plans for sewage treatment plants at the shell loading plant and the village were disapproved.

HEARINGS ON MATTERS RELATING TO SEWAGE.

AUDUBON:—On January 22d, 1918, a hearing was given to representatives of the municipality relative to the unsatisfactory operation of the sewage treatment plant.

BORDENTOWN:—On January 22d, 1918, a hearing was given to the municipal officials relative to the unsatisfactory operation of the sewage treatment plant.

BROWNS MILLS:—August 13th, 1918, a hearing was given to the representatives of the Browns Mills Company relative to the construction of an adequate sewage treatment plant.

BUTLER:—Representatives of the American Hard Rubber Company appeared before the Department on February 4th, 1919, and March 4th, 1919, relative to the pollution of the Pequannock river by industrial wastes.

BUTLER:—On September 30th, 1918, representatives of the Pequannock Rubber Company were heard in reference to the installation of a treatment plant for industrial wastes.

DOVER:—On January 4th, 1918, and on July 2d, 1918, hearings were given the municipal officials and other interested parties relative to the pumping of polluted waters from cellars into storm sewers.

EWING TOWNSHIP:—In April, 1918, and in May, 1918, hearings were given to the representatives of the local board of health and the Agasote Mill-board Company relative to the pollution by industrial wastes of a tributary of the Delaware river.

MAYWOOD:—On November 27th, 1918, a hearing was given to a representative of the municipality relative to its failure to construct the sewage treatment plant in accordance with the plans approved by the Department.

MIDDLESEX TOWNSHIP:—In November, 1917, and in February, 1918, hearings were given to representatives of the township, Bound Brook, and of the Joint Sewage Treatment Plant near Dumellen, relative to odors and pollutions produced by the treatment plant.

MORRISTOWN:—On December 4th, 1917, the officials of the municipality appeared before the Department to show cause why additional units should not be constructed at the sewage treatment plant. On July 23d, 1918, the municipal officials presented plans for additional sand filtration beds.

JERSEY CITY:—On April 2d, 1918, representatives from Jersey City and Dover were given a hearing relative to the submission of plans by Jersey City for an intercepting sewer and sewage treatment plant to receive the sewage from Rockaway Valley.

PEMBERTON:—Numerous hearings were given the officials of the Pemberton Township Water, Light and Sewerage Company, relative to the unsatisfactory operation of the present sewage treatment plant.

PEMBERTON:—On March 13th, 1919, a hearing was given to an official of the General Manufacturing Company relative to the pollution of Rancocas creek by industrial wastes.

PHILLIPSBURG:—Numerous hearings were given relative to the installation of a sewage treatment plant.

RAHWAY:—On January 14th, 1919, representatives were given a hearing relative to the pollution of the Rahway river by industrial wastes coming from the plant of the Chemical Company of America.

RIDGEWOOD:—On May 7th, 1919, the municipal officials were given a hearing relative to the unsatisfactory operation of the sewage treatment plant.

RIVERSIDE:—On November 26th, 1918, a hearing was given to the officials of the borough of Riverside, Hackensack, Delford and Bogota, relative to the gross pollution of the Hackensack river by the effluent from the sewage treatment plant at Camp Merritt.

SPRINGFIELD:—Numerous hearings were given to representatives of the Chemical Company of America relative to the pollution of the Rahway river by industrial wastes.

TRENTON:—On March 18th, 1919, a hearing was given to representatives of Trenton and other interested parties relative to the pollution of Assanpink creek.

WESTFIELD:—On March 5th, 1918, representatives of the municipality were given a hearing relative to the unsatisfactory operation of the sewage treatment plant.

WATER WORKS, THE PLANS FOR WHICH HAVE BEEN ACTED UPON OR THE WORKS CONSTRUCTED.

ALLWOOD (Brighton Mills):—A new water supply from a driven well, 10 inches in diameter and 231 feet in depth, was approved on March 19th, 1918.

ATLANTIC CITY:—On September 3d, 1918, an additional water supply from a new well, 10 inches in diameter and 200 feet in depth, was approved. A supply from another well, 10 inches in diameter and 100 feet in depth, was approved on November 26th, 1918.

BERNARDSVILLE (Bernards Water Company):—On March 19th, 1918, plans were approved for the installation of a water treatment plant consisting of a rapid sand gravity filter, 13½ feet square and 4 feet in depth; a coagulation basin with two compartments, each compartment 17½ feet in width, 53 feet in length, and 4½ feet in depth; and a wash water tank with a capacity of 14,300 gallons. This plant has not been constructed.

DOVER:—Plans were approved November 12th, 1918, for the installation of a manual control direct feed chlorinator.

ELLIZABETH (Elizabethtown Water Company):—The water filtration plant was placed in operation in April, 1919.

FREEHOLD:—Plans and an additional source of water supply were approved on December 4th, 1917, from two driven wells, each 8 inches in diameter and 100 feet in depth.

HALEDON:—Plans were approved on February 19th, 1918, for a water treatment plant with the following units: Two slow sand filters, each 42 feet in width, 50 feet in length, and 28 inches in depth; and two clear water basins, each with a capacity of 14,500 gallons. This plant has not been constructed.

DIRECTOR'S REPORT.

9

MAYS LANDING (Mays Landing Water Power Company):—Plans were approved on May 13th, 1919, for an additional source of water supply from a driven well, 6 inches in diameter and 178 feet in depth.

MEDFORD:—On March 18th, 1918, plans were approved for the installation of a manual control solution feed chlorinator.

PATERSON (Montclair Water Company):—On May 28th, 1918, plans for ten additional rapid sand gravity filter units were approved, each 14½ feet by 15 feet, by 5 feet in depth. These units are equipped with the Wheeler strainer bottoms, and enlarge the plant capacity by ten million gallons per day.

VINCENTOWN (Vincentown Water Company):—Plans were approved May 13th, 1919, for a solution feed chlorinator.

HEARINGS ON MATTERS RELATING TO POTABLE WATER SUPPLIES.

BERNARDSVILLE:—On November 26th, 1918, a hearing was given to the representatives of the Bernards Water Company and other interested parties relative to the installation of a satisfactory water purification plant.

BOUND BROOK:—On April 1st, 1919, a hearing was given to the representatives of the Bound Brook Water Company and interested citizens of the municipality relative to the quality of the water supplied.

BURLINGTON:—On March 5th, 1918, a hearing was given to representatives of the city relative to the unsatisfactory operation of the water purification plant.

ELIZABETH:—On January 22d, 1918, a hearing was given to representatives of the Elizabethtown Water Company relative to the installation of a satisfactory water purification plant.

LUMBERTON:—On June 4th, 1918, a hearing was given to the representatives of the Lumberton Light, Water and Sewerage Company relative to the installation of some method for the purification of the water supplied.

MEDFORD:—On August 7th, 1918, a hearing was given to the Medford Water Company relative to the installation of some method for the purification of the water supplied.

NEW BRUNSWICK:—On March 7th, 1918, a hearing was given to the officials relative to the unsatisfactory operation of the municipal water purification plant.

PATERSON:—On February 5th, 1918, representatives of the Montclair Water Company appeared before the Department and requested that the company be allowed to supply to its consumers unfiltered water treated with chlorine. Permit was granted for request, which was caused by great shortage of water due to climatic conditions. On February 19th, 1918, interested parties of Montclair and neighboring municipalities were heard relative to the rescinding of the above permit, as the great shortage of water in the district supplied by the Montclair Water Company no longer existed.

PEMBERTON:—On October 29th, 1918, a hearing was given to the representatives of the Pemberton Township Water, Light and Sewerage Company, relative to the installation of some method for the purification of the water supplied.

SOMERVILLE:—On January 8th, 1918, a hearing was given to the representatives of the Somerville Water Company relative to the quality of the water supplied by the company.

VINCENTOWN:—On July 18th, 1918, a hearing was given to the Vincentown Water Company relative to the installation of some method for the purification of the water supplied.

WOODBIDGE:—On March 5th, 1918, a hearing was given to representatives of the Middlesex Water Company relative to the unsatisfactory operation of the water purification plant.

DEPARTMENT OF HEALTH.

No tabulations or charts in reference to births, marriages and deaths were published for the calendar year 1917, due to the change in the date of filing yearly reports, therefore the figures in reference to this data which appear in the following pages have been combined to show both the calendar year 1917 and the calendar year 1918, together with continuation of previous years.

During the year 1918 the Bureau received 60,852 certificates of death; 74,549 certificates of birth; 23,989 certificates of marriage, and 3,525 certificates of still-birth, making a total of 162,915.

Population—The total estimated mid-year population of New Jersey for the year 1918 was 3,080,371.

Deaths—The death-rate for 1918 is 19.75, for 1917 the rate was 14.44, and the increase of the past year over 1917 is caused by the great number of deaths due to influenza.

Births—The birth-rate for 1917 was 24.98, and for 1918, 24.20. The figures showing the total births for 1917 and 1918 are as follows: 75,309 births in 1917, and 74,549 births in 1918, a decrease of 760 births.

Comparative Death-Rate of White and Colored Inhabitants—The death-rate among the whites for the year 1917 was 14.12, and for 1918, 19.30. The death-rate among the colored inhabitants for 1917 was 23.29, and for 1918, 32.17.

Marriages—The number of marriages recorded for 1918 was 23,989, a decrease of 6,071 from the previous year. The marriage rate for 1918 was 15.58 as compared with 19.94 for the previous year.

CHART SHOWING TOTAL DEATHS PER 1,000 POPULATION FOR 40 YEARS.

DIRECTOR'S REPORT.

DEATHS FROM CERTAIN CAUSES AND RATES PER 10,000 POPULATION WITH PROPORTION OF DEATHS FROM EACH TO TOTAL DEATHS, 1917 AND 1918.

CAUSE OF DEATH.	Deaths.		Rate per 10,000 population.		Proportion to total deaths.	
	1917.	1918.	1917.	1918.	1917.	1918.
Typhoid fever	194	160	.6	.5	.4	.3

DIRECTOR'S REPORT.

DEATHS FROM TUBERCULOSIS OF LUNGS PER 10,000 POPULATION FOR 40 YEARS.

DEATHS UNDER FIVE YEARS OF AGE PER 10,000 POPULATION FOR 40 YEARS.

Diphtheria—The death-rate from diphtheria for the year 1917 was 1.48 per 10,000 inhabitants, a slight decrease from the previous year. It is gratifying to note that this once fatal disease is causing fewer deaths each year.

Deaths in New Jersey from diphtheria, with ages at decease, for the year ending December 31, 1917, were: under 1 year, 32; 1 year, 76; 2 years, 71; 3 years, 57; 4 years, 43; 5 to 9 years, 129; 10 to 19 years, 27; 20 to 29 years, 2; 30 to 39 years, 3; 40 to 49 years, 2; 50 to 59 years, 4; 80 to 89 years, 1. Total, 447.

DEPARTMENT OF HEALTH.

For 1918 the death-rate from diphtheria was 1.62 per 10,000 inhabitants.

Deaths from this disease by age periods for 1918 were: under 1 year, 24; 1 year, 86; 2 years, 74; 3 years, 56; 4 years, 58; 5 to 9 years, 144; 10 to 19 years, 30; 20 to 29 years, 11; 30 to 39 years, 7; 40 to 49 years, 6; 50 to 59 years, 1; 60 to 69 years, 1. Total, 498.

DEATHS FROM DIPHTHERIA PER 10,000 POPULATION FOR 40 YEARS.

Typhoid Fever—The number of deaths from typhoid fever in New Jersey for the year 1917 was 194, exactly the same figures shown for the previous year, and the death-rate per 10,000 inhabitants was .64.

The total number of deaths from typhoid fever for 1918 was 160, and the death-rate per 10,000 inhabitants, .52, a slight decrease from the previous year.

This disease is entirely preventable, and it is hoped that with proper educational methods the number of deaths from the same will be reduced to a minimum.

The deaths from typhoid fever by age periods for the year 1917 were: 2 years, 1; 3 years, 1; 4 years, 1; 5 to 9 years, 14; 10 to 19 years, 39; 20 to 29 years, 59; 30 to 39 years, 23; 40 to 49 years, 30; 50 to 59 years, 15; 60 to 69 years, 6; 70 to 79 years, 4; 80 to 89 years, 1.

The deaths from typhoid fever by counties in New Jersey for the year 1917 were: Atlantic, 7; Bergen, 13; Burlington, 12; Camden, 18; Cape May, 1; Cumberland, 6; Essex, 23; Gloucester, 3; Hudson, 23; Hunterdon, 3; Mercer, 9; Middlesex, 13; Monmouth, 14; Morris, 5; Ocean, 1; Passaic, 22; Salem, 3; Somerset, 8; Sussex, 1; Union, 8; Warren, 1. Total, 194.

DIRECTOR'S REPORT.

The deaths from typhoid fever by age periods for the year 1918 were: under 1 year, 1; 2 years, 2; 3 years, 1; 4 years, 1; 5 to 9 years, 10; 10 to 19 years, 33; 20 to 29 years, 54; 30 to 39 years, 31; 40 to 49 years, 11; 50 to 59 years, 11; 60 to 69 years, 4; 80 to 90 years, 1.

The deaths from typhoid fever by counties in New Jersey for the year 1918 were: Atlantic, 4; Bergen, 5; Burlington, 11; Camden, 15; Cape May, 2; Cumberland, 11; Essex, 19; Gloucester, 4; Hudson, 20; Hunterdon, 2; Mercer, 7; Middlesex, 10; Monmouth, 18; Morris, 4; Ocean, 0; Passaic, 9; Salem, 3; Somerset, 3; Sussex, 2; Union, 9; Warren, 2. Total, 160.

Bright's Disease—For the year ending December 31st, 1917, 4,183 deaths occurred in New Jersey from Bright's disease, an increase of 333 over the previous year.

In 1918, 3,728 deaths occurred from Bright's disease, a decrease of 455 from the previous year.

Report of the Division of General Administration

CHARLES J. MERRELL, CHIEF.

Under the reorganization of the State Department of Health, which became effective on October 31st, 1915, a Division of General Administration was established to which five clerks were assigned with the Chief, which Division has a supervising relation to all other Bureaus and Divisions of the Department. Within this Division is included the Central Filing Office in which all records, except vital and morbidity statistics, engineering plans, and bacteriological reports, are now filed, together with all correspondence of the Department, except purely routine letters referring particularly to the work of a bureau and having no relation to the work of the Department as a whole.

The work of systematizing the filing of the records from the various bureaus in one central filing office has been a large task, especially in the case of the records of the Bureau of Engineering and the former Division of Milk Control, as it has been necessary to rearrange the filing of these records. In the case of the Bureau of Engineering, which now has charge of the work formerly conducted by the Division of Sewerage and Water Supplies, it was found that many records had been placed in folders without any indexing or filing record of any character, and it has therefore been found necessary to go over all of these records for the past 16 years to index and arrange the same in order that they may be available at a moment's notice. This work has now been completed and has already proven to be of great benefit especially to representatives of the Bureau of Engineering.

This Division has charge of the library of the Department and since this work has been taken up by the Division all books have been rearranged and catalogued and a system has been inaugurated under which every representative of the Department having an interest in the various periodicals received has opportunity to look over said periodicals promptly and to note any articles in the same which he would like to have indexed for future reference. Each interested person is given a definite period of time to look over a periodical after which it is returned to the library, the articles noted indexed and the periodical placed on file in the library.

In addition to the work in connection with the Central Filing Office and Library above referred to, this Division is charged with the reporting of all meetings, conferences and hearings of the Department and the recording of the minutes and reports of the same. All official notices, licenses, permits and correspondence of the Department and of the Director of Health are sent out through this Division, together with the 10,000 monthly bulletins. All financial work of the Department in reference to the making of requisitions, payment of all bills, preparation of the payroll, requests for appropriations, etc., is handled by this Division.

A central stock of articles used in common by all Bureaus or Divisions of the Department has now been established in this Division; the purpose being to obtain the supplies in quantities from the Purchasing Agent and furnish the same to each Bureau or Division from time to time as they may be needed and thus avoid the constant duplication of small requisitions and the holding of a stock of supplies in each office of the Department.

An indication of the increase in the work of this Division will be noted in the fact that the Department July 1st, 1915, had on its payroll 60 employes; the total number of employes at present, June 30th, 1919, including those in the recently reorganized Division of Child Hygiene and the newly created Bureau of Venereal Disease Control, is 114. Appropriations have been granted as follows: 1915, \$132,625.00; 1916, \$133,000.00; 1917, \$145,000.00; 1918, \$175,240.00. In addition to the regular appropriation for 1918, \$5,176.35 was expended from a special appropriation granted by the State House Commission to aid in limiting the spread of Spanish Influenza.

Under an act passed in 1918, a change was made in the fiscal year of the state and the fiscal year now begins on July 1st, instead of November 1st, as formerly. For the year beginning July 1st, 1919, an appropriation of \$319,676.22 has been granted to the Department. This includes an appropriation of \$125,000.00 for the Division of Child Hygiene, an increase of \$100,000.00 above last year and \$27,586.22 for the Bureau of Venereal Disease Control. The sum of \$27,586.22 has also been appropriated by the Government for the Bureau of Venereal Disease Control and the work of this Division, incident to the activities of said Bureau and the Division of Child Hygiene will be largely increased during the coming year.

A petty cash fund, of which the Chief of the Administration Division is Treasurer, and from which money is advanced each month to meet the traveling expenses of inspectors, has proven to be of great benefit to said employes and an aid to the work of the Department.

Under recent acts of the Legislature, the Department is empowered to prepare and sell culture media and to also make charges for the examination of samples of water and food for private parties in

DIVISION OF GENERAL ADMINISTRATION. 23

our Laboratory. A revenue of over \$1,100.00 was received from these two sources last year.

In addition to the regular meetings and hearings of the Department held at the office monthly, bi-monthly or weekly, an average of 20 hearings has been held by the Director each month concerning violations of the food and drug laws, insanitary conditions on dairy premises and creameries, pollution of streams, &c.

Under the regulations of the Department new licenses are issued each year for all creameries, ice cream factories, cold storage warehouses, egg breaking establishments, and slaughter houses in the state, this number being approximately 1,000 a year.

Examinations for health officers and inspectors who desire appointments by local boards of health are held quarterly by the examining board of the Department and licenses have been issued during the past year as follows: health officers, 8; sanitary inspectors, first class, 13; sanitary inspectors, third class, 1; plumbing inspectors, 4; meat inspectors, 1; milk inspectors, 2; food and drug inspectors, 2; operators of sewage disposal plants, 3; operators of water treatment plants, 2. During the year 86 applicants have been examined. A complete list of all persons thus far licensed by the Department since the enactment of Chapter 215 of the Laws of 1903, requiring examination and licensing of applicants, will be found printed in the back of this report.

Report of the Bureau of Medical Supervision

BY A. CLARK HUNT, M.D., CHIEF.

In the reorganization of the State Department of Health in 1908 this Bureau was created. It was intended that in cases of disputed diagnosis, where local physicians were in doubt, or the patient or family was dissatisfied with the diagnosis of the medical attendant, a representative of the State Department should, if possible, assist in arriving at the nature and character of the disease. During the epidemic of infantile paralysis, owing to the fact that the disease was comparatively infrequent and few medical practitioners were acquainted with the diagnostic phases of the disease, many calls for assistance were received, and the services rendered by the Bureau at that time were appreciated. In the more common diseases, such as scarlet fever and smallpox, it is seldom necessary to give aid, as the history of the cases and of evident exposure to these diseases together with the presence of characteristic symptoms generally enable the attending physician to make a correct diagnosis. However, in several cases of scarlet fever occurring especially in the sanitary districts surrounding Camp Dix, where it was important, because of possible exposure of the soldiers to infection, that no error in diagnosis should occur, assistance was sought and given. In the earlier cases of smallpox in Burlington county, in the spring of 1919, the type of the disease was very mild, and since some of the usual symptoms were wanting, local physicians were unable to decide whether some of the cases were or were not smallpox. The chief of the Bureau examined these cases, and in each instance a diagnosis of smallpox was made. As the number of cases increased the physicians became better acquainted with the present-day modified type of the disease, and no further assistance was required.

Another of the duties assigned to the Bureau consists in keeping in touch with the medical men and medical societies of the state, for the purpose of securing co-operation and transmission of information relating to the laws entailing certain duties on the medical profession. Although a number of society meetings have been attended, it is evident that a fixed program is usually planned for these meetings, and the time of the members being limited, it is difficult to create an interest unless some unusual topic, such as The Law Requiring the Reporting of Venereal Diseases, is presented for discussion.

It is doubtless a good policy on the part of the Department to have representatives attend as many of these meetings as possible for the

purpose of answering questions and discussing any points upon which information is requested. When any subject requiring special attention of the medical profession is to be presented it should have thorough publicity in the Public Health News and the public press.

EXAMINATION OF TUBERCULOSIS CLINICS.

Under the provisions of the original act constituting the State Department of Health one of the duties of the Department was to have general supervision over the sanitary condition of the institutions of the state. At a later date the law giving the Department supervision over the County Tuberculosis Hospitals was enacted. Prior to the passage of this special law, relating to the institutional care of persons suffering from tuberculosis, each year a sanitary survey was made of the state institutions. With the increased powers which were given to the Commissioner of Charities a portion of this inspection work was passed to him, and the State Board of Health is always prepared to assist other Departments when any special report of sanitary conditions of a given institution is required.

For several years in the State Department of Health there was a Division which attempted to deal with the problem of prevention of tuberculosis. In the latter part of 1917 a portion of this work was abandoned and greater attention was given to the development of Child Hygiene. Since that time the New Jersey Anti-Tuberculosis League has taken over in part the supervision which was formerly given by this Board, and a thorough survey has been made by the League with respect to the tuberculosis situation in New Jersey.

Recent advances in the knowledge of methods dealing with communicable diseases has caused us to reach the definite conclusion that the very best work that is accomplished is when close personal supervision of the patient is secured.

Aside from the institutional care of persons suffering from tuberculosis there is no agency at the present time that is giving more beneficial results than the tuberculosis clinics in our state. It was said by Dr. James Alexander Miller, that "The tuberculosis dispensary occupies a pivotal position in the whole anti-tuberculosis campaign. It is in intimate contact with all other activities in this field and while the interdependence of all factors is well recognized, it is scarcely too much to say that the dispensary is the one indispensable link in the chain and that a fairly accurate gauge of the successful organization of the anti-tuberculosis forces in a community of any size may be found in its dispensary service."

During the year 1918 a careful sanitary survey was made of the various tuberculosis clinics in the state for the purpose of ascertaining the methods which were adopted in the supervision of patients, and the efficiency of administration. There are eighteen clinics in our state, and separate and extensive reports were made on each clinic.

Without going into detail as to these reports, it may be said that the system which has been adopted in Hudson county is of a very high standard and well deserves commendation. Six clinics in this county are under the supervision of the County Tuberculosis Hospital, and the results of the investigation of the management of the various clinics was satisfactory. Where a County Hospital is maintained this arrangement leads to the best results. Care has been exercised in this county in the selection of sites for tuberculosis clinics so that large areas are covered. Each of the clinics has a competent staff, and is provided with necessary methods for clinical diagnosis. Selection of rooms and the general brightness and cleanliness of all parts of the clinics make them especially attractive, and the number of persons either suspected of having tuberculosis or already suffering from tuberculosis attending the clinics is an evidence of their usefulness.

In Essex county there are a number of clinics but they are maintained by private organizations or under supervision of Boards of Health. In some of our larger cities, such as Newark and Trenton, the clinics have been taken over by the local board of health and the city dispensaries.

In Union county there has been a development along this line, and with a hospital located in the county which is doing most valuable work, the supervision of the tuberculosis clinics will be vested in the superintendent of that institution. The reports from Union county indeed show that this work is being extended, and that splendid results will follow the plan of the general examination of children throughout the county.

In Camden county a very efficient clinic has been established, and more and more calls are being made upon it for assistance.

Mention has only been made of the activities along this line in these counties, but it is evident that there is need of an extension of this system to other counties in the state. During the investigation of the clinics it was evidenced that there is need of raising the standards and an adoption of uniform methods. In some of the smaller clinics it was found that the history of patients and the records of physical examination were not properly kept. It would be well to follow Hudson county in adopting a uniform method of record keeping.

We believe as the county tuberculosis hospitals increase in number, that under the management of these institutions, clinics should be equipped and maintained in every county in the state. The investigation also brings out the fact that there are many of these clinics under the supervision of private anti-tuberculosis associations. These organizations should be relieved of this work, and permitted to use their energies in other lines of prevention. The New Jersey Anti-Tuberculosis League has been doing excellent work along this line, and the survey published by that organization in 1917 is a very complete record of the tuberculosis activities in New Jersey.

PUBLIC HEALTH NEWS.

The Public Health News was first issued in August, 1915, and for each month until October, 1917. It was then discontinued owing to the increase in activities of many of the Bureaus of the Department, and the decrease of our working force due to the enlistment of many of our men in the army. In October, 1918, the Board appointed the Chief of the Bureau of Medical Supervision as editor of the News.

The necessity for continuing the publication is appreciated when we consider that there are over five hundred local boards of health in New Jersey, and many have supervision of rural communities where it is almost impossible to arrange for meetings of the local boards because the members live at far distant points of the township. The policy of the Public Health News is to become a medium by which information may be transmitted to all of the health organizations of the state. The plan which has been adopted is to present, if possible, in each issue one or two leading articles on subjects which are of special interest, and following such articles to transmit information in regard to the activities of the several departments which go to constitute the State Department of Health.

Within a year or two the Child Hygiene Division has been greatly enlarged, and a Venereal Disease Division has been formed. Therefore, a large portion of the space in the News for several months has been devoted to the plans which are to be followed for prosecuting the work of these divisions.

Under Current Notes the effort is made to bring together any points of special moment, and any results of action by the State Department which we believe to be of special interest to those in our state who are giving attention either officially or otherwise to disease prevention and health preservation.

An effort has already been made and will be continued to obtain from the local boards of health information in regard to the solution of local health problems and the administration of laws for dealing with any condition which menaces the health of individuals or communities.

We believe that in the future, with the co-operation of the various bureaus, the material presented from time to time in the Public Health News will be of special interest, and that the information conveyed through its pages will assist those who are responsible for the healthfulness of the various localities in our state.

Report of Bureau of Local Health Administration

D. C. BOWEN, CHIEF.

Following is the report of the Bureau of Local Health Administration for a period of twenty months, dating from October 31st, 1917, to the close of the present fiscal year ending June 30th, 1919. During this entire period of time there has been an unprecedented demand for intensive work along practically every line of public health work falling within the sphere of the Bureau's activities. This country's participation in the war not only made necessary the enforcement of special measures to safeguard the health of soldiers during mobilization and training, but likewise required that special precautions should be taken to protect the civilian population against preventable diseases in order that the country's military effectiveness might be maintained at a high standard.

The establishment of national army cantonments and other camps within the state resulted in increasing the population in the districts in which these military reservations were located, and in some of these localities sanitary supervision was entirely lacking or inadequate to meet the changed conditions. In addition, the congested population that sprang up in the vicinity of a number of the numerous war industrial plants located in the state gave rise to insanitary conditions with which local boards of health were unable to cope, and which had to be handled in a large measure by other agencies with greater resources and better equipment. As a result of these conditions the amount of work which the Bureau of Local Health Administration was called upon to perform was greatly increased over that of normal times. Furthermore, the pandemic of influenza in the Fall of 1918 was of such magnitude and severity that every public health organization in the country was overtaxed, no matter how great their resources may have been.

Three employes on the Bureau's field staff were on leave of absence a considerable portion of the twenty months covered by this report, serving as commissioned officers in the army, and one was transferred to another Bureau in the Department, so that at no time during this period have we had our full quota of personnel. The Bureau's field working force over the time with which this report deals only averaged about 55 per cent of what it was prior to this country's active participation in the war. It has, therefore, not been possible on all occasions to handle matters claiming attention as expeditiously as desired, notwithstanding the fact that considerable time has been devoted to work carried on under the direction of this Bureau by employes of other departmental divisions.

SPECIAL WORK IN EXTRA CANTONMENT ZONE.

The organization established by the State Department of Health in the Fall of 1917 to enforce sanitary regulations in the extra cantonment zone around Camp Dix, was disbanded on January 1st, 1919, after sixteen months of uninterrupted service. The branch office at Wrightstown was closed and supervision over public health matters was turned over to local boards of health in the various sanitary districts included within this zone.

The sanitary unit financed by the American Red Cross, and which had been working under my supervision as a part of this organization, was also disbanded at that time. The supervising public health nurse who had been attached to the unit was employed by the State Department of Health and assigned to the Bureau of Local Health Administration.

While the officer in charge of the work conducted by the State Department of Health in the Camp Dix zone practically became the executive health officer of the entire district, every possible effort was made to have local boards of health in the eleven municipalities in the zone take an active part in the enforcement of the law and the regulations of the State Sanitary Code in their respective districts, particularly in regard to matters that should concern local boards of health in rural districts under normal conditions. The local health officials in each district were kept informed of any work of importance conducted independently of them through the Wrightstown office, in so far as this was practicable. All our activities in this district were conducted on the theory that the most lasting results would be secured by working in co-operation with the local organizations, rather than independent of them, when such co-operation could be secured. As a result of persisting in this policy, when the state organization was withdrawn local boards of health in the zone were much better prepared to carry on their work than before our organization entered the field.

When public health nursing work was begun as a part of the activities of the State Department of Health in the Camp Dix zone, its purpose was not clearly understood by the public in general and was looked upon with considerable disfavor by some who later became its strongest supporters. This was also true of the measures taken to abate certain nuisances of long standing. As the work progressed the attitude of the public changed, and local boards of health came to rely more and more on the assistance and advice they were receiving from the Wrightstown office. When the time came to close the office and recall our field workers, both public officials and private citizens expressed regret, believing that the work should be continued by a central organization exercising jurisdiction over the entire district.

Our public health nursing work had been conducted in a very efficient manner and resulted in accomplishing much good. When it

was proposed to remove the nurse many leading citizens, as well as a number of local health officials, requested that she be allowed to remain at least until funds could be raised by local organizations to employ someone to succeed her, advancing as an argument that the services of a nurse would be greatly needed in the zone during the demobilization of troops from overseas. These requests were favorably considered and the nurse has been working in the district as an employe of the State Department of Health for the past six months, this proving to be a wise move in many respects. In the first place, it has enabled the Department to keep informed on public health conditions as they developed in the zone subsequent to closing the branch office at Wrightstown; secondly, the frequency with which local health officials, civic organizations and private citizens have appealed to the nurse for advice and assistance in handling sanitary problems that have arisen in the meantime, furnishes concrete evidence that the work carried on from the branch office in Wrightstown has been of considerable educational value as well as having fulfilled the purpose for which it was primarily undertaken. Insanitary conditions that formerly passed unnoticed by the public, and that would have resulted in no action on the part of public health officials if brought to their attention, are now taken cognizance of by both. The public sentiment that has been awakened for better sanitary supervision throughout the district will, if followed up by appropriate supervision, most probably be reflected in lowering the morbidity and mortality rates within the next few years.

A special report has been submitted, setting forth in detail the work accomplished in the Camp Dix zone from September, 1917, when the branch office was opened in Wrightstown, until it was closed on January 1st, 1919. This report also includes an itemized statement showing the amount spent by the State Department of Health and by the American Red Cross in conducting this work.

Special investigations have been made in the vicinity of a number of other military and naval reservations in the state, during the period covered by this report. These had to do with outbreaks of communicable diseases and with insanitary conditions in the vicinity of these camps. The results of these investigations have been set forth in special reports which may be consulted by reference to the files.

INFLUENZA EPIDEMIC.

New Jersey, as did most other states, suffered severely from the world-wide pandemic of influenza that reached its crest in this country in the Fall of 1918. The epidemic surpassed by far any preceding outbreak of disease on record, both in the number of cases and deaths that occurred and likewise in the rapidity with which the disease swept over the entire state. The actual number of cases that occurred will never be known and probably not closely approximated, as re-

liable data pertaining to the case incidence could not be secured from enough municipalities in different sections of the state to serve as a basis for making a reliable estimate. It is safe to assert, however, that there has never been another epidemic of disease that extended over any considerable portion of the state in which so large a per cent of the population was attacked, nor in which the fatality rate was so high.

That case reports were not more complete in this epidemic is due primarily to its severity and to the scarcity of doctors then practicing in the civilian population. At the time the pandemic occurred more than 30,000 physicians had been inducted into military service. As a result of withdrawing this large number of physicians from private practice, many communities were left in which medical aid could not promptly be secured at all times even before influenza became prevalent, and during the height of the epidemic there was scarcely a section of the state where there were enough physicians to attend all who contracted the disease. In many places patients died without having been seen by a physician or without having received proper nursing care. While these conditions prevailed many physicians not only failed to report all cases coming under their observation but also failed to keep record from which complete reports could be made later. Others neglected to make any report, either during or subsequent to the epidemic. Even though it had been possible to have gotten complete reports of all cases seen by physicians, there would still have been no means, short of house to house surveys, of learning the number of cases that received no medical care. Furthermore, influenza and pneumonia were not made reportable diseases until October 1st, 1918, at which time the outbreak had already gained epidemic proportions in many parts of the state.

During the months of October, November and December, 292,839 cases of influenza and 18,027 cases of pneumonia were reported to the State Department of Health. No reports were received from a number of municipalities in which the disease is known to have been prevalent. These reports were based on the best information local health officials could obtain under the circumstances with which they were confronted. They were not presumed to be complete in any municipality. A considerable number of cases that occurred during the month of September, before influenza and pneumonia were made reportable, were included in the early October reports sent in by some municipalities, while others made no mention of cases occurring prior to October 1st. It is quite evident, therefore, that reports that reached the Department through the regular channels cannot be relied upon as a measure of the morbidity rate in this epidemic, nor can these reports be used, by reason of their incompleteness, to make an approximation of the case incidence of the disease in the state as a whole, nor in selected groups of municipalities.

After-epidemic surveys were conducted under the supervision of the Bureau of Local Health Administration in three cities. These

LOCAL HEALTH ADMINISTRATION.

33

surveys deal with 36,974 persons and show a case incidence of over 30 per cent of the entire population of the three municipalities. The indicated fatality rate was 3.1 per cent. These communities were not selected for surveys because of any indication that the disease had been relatively more prevalent in them than in many others of corresponding size. They were, however, all located in the southern part of the state, where the epidemic is believed to have been more severe than in the northern and central portion, and for this reason morbidity and mortality rates obtained in these surveys cannot be applied to the entire urban population of the state, nor can they be taken as representing the case incidence and mortality rate in strictly rural communities.

TABLE 1.

NUMBER OF CASES AND DEATHS FROM INFLUENZA AND PNEUMONIA, CASES PER 1,000 POPULATION, DEATHS PER 1,000 POPULATION AND FATALITY RATES AS DETERMINED BY AFTER-EPIDEMIC SURVEYS IN BRIDGETON, GLOUCESTER AND MILLVILLE.

MUNICIPALITY.	Population.	Cases.	Deaths.	Cases per 1,000 Population.	Deaths per 1,000 Population.	Per Cent Fatality.
Bridgeton	13,319	3,845	111	288.6	8.3	2.8
Gloucester	11,969	2,930	148	244.7	12.3	5.0
Millville	11,686	4,749	107	406.3	9.1	2.2
Totals	36,974	11,524	366	311.6	9.8	3.1

Data collected in four institutions during and subsequent to the epidemic, and which deal with 2,696 persons, show that 41.24 per cent of the inmates and employes in this group of institutions contracted influenza during the epidemic, and that 9.53 per cent of the cases proved fatal. However, the case incidence and fatality rates in these institutions are not comparable with those in the average community because they represent selected groups of individuals among whom the distribution of age and sex does not correspond to that which prevails in the population at large.

As was true in other sections of the country, the epidemic in this state first appeared in military and naval reservations. From these foci of infection the disease spread to the civilian population, rapidly assuming epidemic form in the larger communities and later invading the rural districts. Early in September the number of cases of influenza in Camp Dix became alarming and the death-rate from complicating pneumonia soon exceeded anything heretofore experienced at this season of the year. It has been stated that 7,000 cases were treated in the base hospital during the epidemic and that 863 of these cases died, equal to a fatality rate of 12.3 per cent.

During September, October, November and December, 10,962 deaths from influenza were reported in the civilian population of the state, together with 5,874 deaths from pneumonia attributable to influenza as the pre-disposing cause. In addition, 1,471 deaths from influenza and pneumonia were reported during the same period of time from military and naval reservations in the state. Therefore, the epidemic was accountable for 17,407 deaths in New Jersey during the last four months of 1918.

As nearly as can be determined the epidemic reached its crest in New Jersey during the third week in October, about one month later than at Camp Dix. In some localities, however, cases were relatively few until the epidemic was practically over in the larger cities and more thickly populated areas. This was noticeably true in a number of smaller municipalities and rural districts. According to case reports and the most reliable information obtainable a pronounced recrudescence of the disease occurred in many communities about two months after the crest of the epidemic had passed, although the fatality rate in these later cases was apparently much less than occurred when the epidemic was at its height. There is also some evidence which tends to show that a relatively higher per cent of cases occurred among children under school age in these secondary outbreaks. If true, this may be attributable to the reopening of schools which had been closed as a precautionary measure against the spread of infection.

CHART SHOWING REPORTED CASES AND DEATHS PER 1,000 POPULATION FROM INFLUENZA AND PNEUMONIA BY WEEKS FROM OCT. 10, 1918, TO JAN. 2, 1919.

Deaths per 1,000 pop

Note: - Deaths per 1,000 pop shown by weeks Oct 10 - Nov 28 only.

The means adopted by local health officials to prevent the spread of influenza during the early part of the epidemic were rather drastic in some municipalities, while in others little or nothing was done. Definite knowledge concerning the methods by which the infection is transmitted could not be obtained, and public health officials were therefore at a loss to know how best to proceed when the number of

cases was found to be rapidly increasing in spite of their efforts. As a result the State Department of Health received urgent appeals from all parts of the state for a set of regulations containing the minimum requirements that should be enforced in each community. To meet the situation the Director of Health issued an order on October 5th, 1918, containing specific regulations to be enforced by local boards of health. These regulations were based on the presumption that the infection was mainly spread by personal contact and aimed to restrict the congregation of large numbers of persons, in so far as this could be accomplished without seriously interfering with the necessary movements of those engaged in essential businesses.

There were very few municipalities in which these regulations were not promptly recognized by local boards of health as binding upon them to enforce, and the public in general showed a commendable spirit of co-operation in the efforts made by public health officials to control the epidemic and to minimize the suffering which followed in its wake. With the exception of a few municipalities in which public officials yielded to political influence brought to bear by persons representing certain interests that were being injuriously affected by the closing of non-essential businesses, the regulations issued by the Director were enforced by local boards of health until the epidemic had subsided in their respective localities so that, in the judgment of the Director, the necessity for their further observance had passed.

EMERGENCY RELIEF MEASURES.

On account of the scarcity of doctors and nurses in many stricken communities, the United States Public Health Service announced that the service was prepared, through the arrangement that had been made with the American Red Cross, to furnish physicians and nurses to work in co-operation with state and local health authorities in furnishing medical relief. Taking advantage of this arrangement, on October 4th, 1918, the Director appealed to the Surgeon General for physicians and nurses for the city of Gloucester. In response to this request Passed Assistant Surgeon Treadway was sent to Trenton as Senior Officer in charge of the U. S. Public Health Service's emergency relief work in New Jersey. Two days later he was stricken with influenza and was obliged to spend two weeks in a hospital. Acting on instructions from the Surgeon General, the writer directed the U. S. Public Health Service relief work in New Jersey during the forced absence from duty of Captain Treadway.

The Atlantic Branch of the American Red Cross sent a representative in the person of Mr. E. D. Easton to facilitate the work of that organization in furnishing nurses and emergency hospital supplies to stricken communities when the necessity for such relief was certified to by an authorized agent of the State Department of Health.

At the request of the Director, His Excellency, the Governor, authorized the Comptroller to set aside from an emergency appropriation the sum of \$10,000 to be used by the State Department of Health for influenza relief work throughout the state. With additional help employed by money from this fund the State Laboratory of Hygiene was able to manufacture influenza vaccine for free distribution in sufficient quantities to meet the requirements of local boards of health and practicing physicians who were unable to procure supplies from commercial manufacturers. Though ample money was available for the employment of physicians and nurses they could not be secured in sufficient numbers to meet even the most pressing demands.

During the epidemic the U. S. Public Health Service furnished 29 physicians and 10 nurses, and the American Red Cross provided 42 nurses. These physicians were given 48 assignments and the nurses 61 in response to 111 requests for physicians and 176 for nurses from 59 separate municipalities. The physicians were on duty a total of 673 days and the nurses 472 days. In some localities emergency hospitals were open for several days before patients could be received because nurses and physicians could not be secured to operate them, although municipal officials offered nurses exorbitant salaries and paid physicians as high as \$100.00 per day.

Inability to find nurses who were willing to serve in hospitals and to do community bedside nursing during this epidemic was mainly due to the following reasons: in the first place, the ranks of the nursing profession had been greatly depleted, many having accepted service in the American Red Cross and other organizations for overseas duty. In the second place, many nurses were engaged in public health nursing work, community welfare work and similar activities in this country, and this made further inroads on the number available to do bedside nursing exclusively. Furthermore, the demand for nurses in private cases was never so great, and for the private patient who could amply afford to pay for individual service the cost of such service ceased to be a consideration. Under these conditions it can readily be seen why it was so difficult to find nurses willing to take assignments in emergency influenza hospitals and to accept temporary employment with local boards of health to do bedside nursing in private homes.

The Atlantic Division of the American Red Cross assisted in equipping 20 influenza emergency hospitals in New Jersey, of which we have knowledge. With the facilities at the disposal of this organization it was able to deliver a complete hospital equipment to any part of the state within a few hours after its need had been demonstrated. This prompt and valuable service relieved much suffering and doubtless resulted in saving many lives in communities where funds were not immediately available to enable local officials to open hospitals in time to meet the greatest emergency.

For the purpose of securing data as a matter of record pertaining to various activities of local boards of health throughout the state during the epidemic, a number of questions dealing with points of general interest were inserted in the blank prepared for the annual reports of local boards of health for the calendar year of 1918. As was anticipated when the questionnaire was sent out, the information furnished by the majority of municipalities is not complete in respect to all details, and there is a number of municipalities from which no reports have yet been received. However, tabulations that have been compiled contain much information of interest bearing on the severity of the epidemic, as well as on the methods employed by local boards of health to check its spread, to open hospitals and carry on other relief measures.

We find that at least 53 municipalities equipped emergency hospitals during the epidemic. New buildings were erected expressly for this purpose in three of these municipalities while in the remaining 50 it was possible to find old buildings either vacant or that could be vacated and quickly equipped as emergency hospitals at relatively low cost. These 53 emergency hospitals had 1,900 beds and 3,002 patients were treated during the epidemic, 592 of whom died, a fatality rate of 19.92 per cent.

Forty-three municipalities report 7,315 cases treated in general hospitals, among whom 1,393 deaths occurred, equal to a fatality rate of 19.18 per cent. From these figures it appears that the fatality rate among cases treated in these general hospitals and those treated in emergency hospitals was practically the same. As a rule, only the more severe type of cases were admitted to hospitals, which accounts for the high fatality rates in these institutions.

Four hundred and thirty-six municipalities report treatment given to 12,862 cases in private homes by 67 physicians in the employ of, or working under the supervision of, local boards of health, at a total cost of \$9,992.00. Nursing relief was furnished in 8,522 cases in private homes by 229 nurses in the employ of or working under the direction of local boards of health, at a cost of \$9,209.73.

Two hundred and sixty-one municipalities, in which the aggregate population was about 2,445,000, report that 1,724 practicing physicians were residing in these municipalities when the epidemic occurred. Of this number 165 were reported to have contracted influenza or pneumonia from which 16 died, equal to a case incidence of 9.34 per cent and a fatality rate of 9.93 per cent. According to the information there was an average of one physician to about 1,360 of the population in these municipalities.

One group of 50 municipalities, representing a population of about 565,000, reported that 178 non-resident physicians were secured for emergency medical relief work at some time during the epidemic, 3 of whom died of pneumonia contracted while thus employed.

SMALLPOX.

Smallpox has been unusually prevalent during the past eighteen months, principally in the southern part of the state. Out of 172 cases reported the majority was connected with three independent outbreaks, two of which originated in Atlantic and one in Gloucester county. One of the outbreaks in Atlantic county is believed to have been responsible for 44 cases that occurred in three municipalities in that county, 50 cases that occurred in six municipalities in Cape May county, 7 cases in one municipality in Camden county and 25 cases in six municipalities in Burlington county.

The source of infection causing the outbreak in Gloucester county was definitely traced to a negro woman who came to Paulsboro from Essex county, Virginia, while broken out with an eruption alleged to have been diagnosed as chickenpox before leaving her southern home for New Jersey. The original source of infection causing the outbreaks in Atlantic county was not established in either case, probably owing to the fact that in both outbreaks several weeks had elapsed before an investigation was started. There can be no doubt, however, but that the spread of the disease was directly due to failure on the part of physicians to report cases diagnosed as chickenpox in the early stages of both outbreaks.

That many physicians are still delinquent in reporting cases of chickenpox was demonstrated in the investigations conducted by this Bureau in each of the outbreaks of smallpox above referred to, notwithstanding this disease has been reportable for many years. If the cases occurring early in these outbreaks had been reported as chickenpox, in all probability such reports would have attracted the attention of health officers and lead to a corrected diagnosis in time to have prevented wide-spread infection. When any considerable number of cases is being reported and the proportion of cases is as high among adults as among children, the diagnosis is not likely to be accepted without question by a competent health officer.

Other sporadic cases and small localized outbreaks of smallpox, due to independent sources of infection, occurred in Burlington, Camden, Cumberland, Essex, Gloucester, Hudson, Hunterdon, Monmouth, Morris and Passaic counties. Most of these isolated cases and localized outbreaks were due to infection received in other states.

There were no fatalities from the 172 cases of smallpox reported during the past twenty months. None were due to a "virulent" type of infection and none of the patients were seriously ill. However, an outbreak due to infection from what has come to be recognized as a "non-virulent" form of the disease is treated by the average local board of health in as drastic a manner as one due to a "virulent" type of infection. The fact that the former seldom, if ever, results in more than economic loss, while an outbreak caused by a "virulent" type of infection is usually accompanied by a high death-rate, as well

as an economic loss and prolonged cases of severe illness, is seldom taken into consideration by local health officials. Perhaps this is due in a measure to the dread with which the general public looks upon this disease, while the more common communicable diseases receive scant attention notwithstanding they are responsible for a greater amount of sickness and more deaths.

OUTBREAKS OF GASTRO ENTERITIS.

During the early part of January, 1918, an explosive and widespread outbreak of gastro enteritis occurred in the city of Elizabeth and nearby communities and caused much alarm until it became apparent that the outbreak was not due to typhoid infection and it was found that persons affected were not made dangerously ill. At about the same time an entirely independent outbreak of the same character occurred in a group of municipalities in Essex, Hudson and Passaic counties. In some municipalities more than 15 per cent of the population are believed to have been affected. Many persons were made quite ill but the majority of the cases cleared up within two or three days. Specimens for laboratory examination were collected from a number of patients in an effort to establish a positive diagnosis but the results were negative.

According to data collected in epidemiological investigations that were conducted, it seemed altogether probable that the public water supply was at fault in each outbreak, but this could not be definitely proven in either case. Outbreaks of a similar character were reported in other states at about the same time of the year, all occurring after a prolonged spell of severe cold weather and generally attributed to some unknown causative agent distributed through the public water supplies.

TYPHOID FEVER.

During the great part of the past twenty months conditions have prevailed in many parts of the state which might reasonably be expected to result in an abnormally high typhoid fever rate. Housing accommodations were inadequate in many industrial centers to which people were attracted from all parts of the country by the high wages which were paid, and where they were obliged to live under sanitary conditions that, in many cases, were far from ideal. In spite of these conditions there have been no typhoid outbreaks of any considerable size during the past twenty months, and there were fewer cases and deaths reported in 1918 than in any year since 1910.

That typhoid fever has not been more prevalent under these conditions must be very largely due to anti-typhoid vaccination, compulsory in all branches of military service, that was strongly advocated in many industrial plants during the war. Furthermore, since this country began active preparations for war, sanitary regulations for

the prevention of the spread of communicable diseases have been more generally and vigorously enforced than ever before. This has included supervision over food vending establishments and, in some cases, medical examination of food handlers, both measures being important factors in preventing the spread of typhoid fever.

Since 1910 there has been a yearly diminution in the number of deaths from typhoid fever in New Jersey, as will be seen by reference to Table 2. Improvement of public water supplies has doubtless had more to do in producing this result than any other one factor. Supervision over the milk supply has also helped in a measure, particularly where pasteurization has been practiced for commercial reasons or required as a public health measure. If health officials would require the abolishment of insanitary privies in municipalities in which there are sewers, and if regulations should be rigidly enforced requiring safe methods of disposal of human excrement in all communities and in rural districts where there are no sewers, the death-rate from typhoid would become a negligible factor. The necessity of this work in the rural districts is emphasized by the fact that the death-rate from this disease in 1918 was practically twice as high in rural districts in the state as in the urban communities.

SCARLET FEVER.

There were more deaths from scarlet fever in 1918 than during the preceding year, although fewer cases were reported. The first six months of 1919 show a marked increase in the number of cases reported and a corresponding increase in the number of deaths.

DIPHTHERIA.

Diphtheria caused more deaths in 1918 than in either of the two years immediately preceding, yet there were fewer cases reported.

MEASLES.

Measles were unusually prevalent in most parts of the state during a portion of the year 1918. There were 28,310 cases and 523 deaths reported, exclusive of cases and deaths that occurred in military reservations within the state. The death-rate from measles in 1918 was 1.69 per 10,000 population, the highest recorded since 1896.

WHOOPIING COUGH.

Whooping cough must have been far more prevalent in 1918 than is indicated by the 8,310 cases reported, since there were 562 deaths, equal to a fatality rate of 6.7 per cent.

LOCAL HEALTH ADMINISTRATION.

41

TABLE 2.

TABULATION OF REPORTED CASES AND DEATHS FROM CERTAIN COMMUNICABLE DISEASES FOR THE 9 YEARS 1910-1918. (MEASLES AND WHOOPING COUGH WERE REPORTABLE ONLY SINCE JUNE 1ST, 1917.)

YEAR.	<i>Typhoid Fever.</i>		<i>Scarlet Fever.</i>		<i>Diphtheria.</i>		<i>Measles.</i>	<i>Whooping Cough.</i>
	<i>Cases.</i>	<i>Deaths.</i>	<i>Cases.</i>	<i>Deaths.</i>	<i>Cases.</i>	<i>Deaths.</i>	<i>Deaths.</i>	<i>Deaths.</i>
1910. . . .	1,134	392	6,955	229	5,072	630	186	389
1911. . . .	1,617	337	5,335	214	5,884	458	281	364
1912. . . .	2,024	328	3,987	146	4,829	412	296	211
1913. . . .	1,825	216	5,255	218	6,374	506	216	386
1914. . . .	1,604	223	6,552	242	6,863	545	240	299
1915. . . .	1,425	188	4,735	97	7,410	501	205	259
1916. . . .	1,390	194	4,209	69	5,580	444	344	262
1917. . . .	1,151	191	4,776	49	5,326	447	121	292
1918. . . .	730	162	2,818	57	4,465	485	523	562

VENEREAL DISEASES.

The close of 1918 marked the first complete calendar year during which venereal diseases were reportable by law to the State Department of Health. During this time 12,115 cases have been reported: 9,530 cases from cantonments and military camps, 64 cases from industrial plants under Federal control or supervision, 231 cases from state institutions and 2,290 by private practitioners. The reports from military camps represent 78.6 per cent, those from state institutions and Federal industrial plants 2.4 per cent and those from physicians in private practice 18.9 per cent of the total cases reported.

TABLE 3.

NUMBER OF CASES OF VENEREAL DISEASES REPORTED TO THE STATE DEPARTMENT OF HEALTH FROM MILITARY CAMPS, INDUSTRIAL PLANTS UNDER FEDERAL SUPERVISION, STATE INSTITUTIONS AND FROM PRIVATE PHYSICIANS DURING THE CALENDAR YEAR 1918.

	<i>Syphilis.</i>	<i>Gonorrhoea.</i>	<i>Chancroid.</i>	<i>Total.</i>
Military reports	987	8,110	433	9,530
State institution reports	226	5	0	231
Federal industrial reports	20	41	3	64
Physicians' reports	962	1,266	62	2,290
Totals	2,195	9,422	498	12,115

Of the 9,530 cases reported by the military authorities 1,443 were among persons who were residents of New Jersey at the time of induction into the military service. Inasmuch as the reports of these cases give the home addresses of the infected individuals, they have been considered as cases reported from the municipality in which the infected person resided when inducted into military service, and are shown by counties in Table 4, together with the cases reported by physicians in private practice.

TABLE 4.

NUMBER OF CASES OF VENEREAL DISEASES REPORTED DURING THE CALENDAR YEAR OF 1918 IN RESIDENTS OF NEW JERSEY BY MILITARY AUTHORITIES AND BY PRIVATE PRACTITIONERS.

<i>COUNTY.</i>	<i>Cases Reported from Military Sources.</i>	<i>Cases Reported Among Civilian Population.</i>

Salem	56	3
Somerset	10	14
Sussex	4	8
Union	64	84
Warren	10	10
State	1,443	2,290

Comparison of the number of cases reported by the military authorities in residents of New Jersey and those reported by physicians in private practice, appears to indicate failure on the part of the latter to report cases in certain localities, notably in Salem, Cape May, Atlantic and Hudson counties.

In comparing the total number of cases of each of the three venereal diseases reported by the military authorities with the number reported by physicians in private practice, it appears that the private practitioners have been more remiss in reporting cases of gonorrhoea and chancroid than in reporting syphilis, as may be seen by reference to Table 3. This may be partly accounted for by the practice of checking the reports of all positive Wasserman examinations made in the State Laboratory of Hygiene with the cases of syphilis reported, and where specimens giving a four plus Wasserman were not followed in due time by a case report, a follow-up letter was sent to the physician asking for an explanation.

The number of cases of venereal diseases reported by private practitioners, together with the indicated case rates per 1,000 population as shown by these reports, is shown by counties in the following table, with the counties arranged in the order of indicated decreasing case rates:

LOCAL HEALTH ADMINISTRATION.

43

TABLE 5.

NUMBER OF CASES OF VENEREAL DISEASES REPORTED BY PRIVATE PHYSICIANS DURING THE CALENDAR YEAR 1918, ARRANGED BY COUNTIES IN THE ORDER OF INDICATED DECREASING CASE RATES.

<i>COUNTY.</i>	<i>Population.</i>	<i>Cases.</i>	<i>Rate per 1,000 Population.</i>
Camden	170,604	280	1.67

DEPARTMENT OF HEALTH.

TABLE 10.

NUMBER OF CASES AND INDICATED CASE RATE OF VENEREAL DISEASES REPORTED BY PRIVATE PHYSICIANS IN MUNICIPALITIES OF OVER 50,000 POPULATION DURING 1918.

MUNICIPALITY.	Population.	No. of Cases.	Cases per 1,000 Population.
Group 1—Over 100,000 Population:			
Newark City	428,682	627	1.46
Jersey City	318,769	62	.19
Paterson City	142,581	197	1.38
Trenton City	116,355	192	1.38
Camden City	110,001	245	2.22
	1,116,388	1,323	1.19
Group 2—50,000 to 100,000 Population:			
Elizabeth City	90,970	41	.45
Hoboken City	79,434	26	.32
Passaic City	77,212	13	.16
Bayonne City	74,515	12	.16
Atlantic City	61,368	50	.81
	383,499	142	.37

COMMUNICABLE DISEASES ON DAIRY PREMISES.

During the past twenty months communicable diseases known to be transmissible through milk were reported on 69 dairies. In only 10 of these was it found necessary to prohibit the sale of milk during the infectivity of the patient. Effectual isolation or removal of the patient from the premises was found to be efficacious in preventing the spread of infection in the remainder of the cases.

MORBIDITY REPORTS.

During the year 1918 reports of 385,142 cases of reportable diseases were received in the Bureau of Local Health Administration, exceeding by nine times the total number of cases reported during 1917 and thirteen times the number reported during 1916.

TABLE 11.

NUMBER OF CASES OF REPORTABLE DISEASES REPORTED TO THE STATE DEPARTMENT OF HEALTH DURING THE YEARS 1916, 1917 AND 1918.

	1916.	1917.	1918.
Cases of diseases reportable prior to 1917	29,011	27,308	61,441
Additional diseases made reportable since 1916 ..	0	13,092	310,866
Cases of above two classes reported from military posts	0	847	12,835
Totals	29,011	41,247	385,142

Measles, whooping cough and several other less common diseases made reportable by an amendment to the State Sanitary Code, which took effect June 1st, 1917, accounts for the marked increase in the total number of morbidity reports received in 1917 over the total number of cases reported in 1916. The epidemic of influenza explains the large increase in the number of morbidity reports in 1918. Barring epidemics of unusual magnitude, we may reasonably expect to receive reports of about seventy-five or eighty thousand cases of preventable diseases in 1919.

Based on reported cases and deaths the indicated fatality rates from diphtheria, typhoid fever and tuberculosis show a substantial increase in 1917 over the fatality rates for the same diseases in 1916. A still further increase in the fatality rate from all three of these diseases occurred in 1918. The indicated fatality rate for scarlet fever in 1917 shows a slight increase over the rate for 1916, and the rate in 1918 is twice as high as it was in 1917. From these results it would at first appear that these four diseases have been more fatal in the past two years. However, this is probably not true, since the case incidence has steadily declined during the same period of time. These results probably mean poor reporting in 1917 and 1918 rather than an actual increase in fatality rates. A large number of physicians were serving in the army in 1917 and 1918 which made it more difficult to find physicians to attend cases of illness in the civilian population than it was before the war, and this would possibly have a tendency to cause parents to neglect to call a physician for cases of slight illness in the family, and in this wise many cases of reportable diseases may have been overlooked. Furthermore, experience has shown that, as a rule, physicians who have graduated in more recent years take greater pains to report communicable diseases than many older practitioners, and it was the younger members of the medical profession who were inducted into military service.

The volume of clerical work involved in handling morbidity reports during the 1918 epidemic of influenza was so great that it has not been possible to transfer the data from all reported cases of communicable diseases in time to furnish standard tables for publication in this report. It will, therefore, be necessary to defer publication of these tables for 1918 until the next annual report is issued. Standard tables for cases of communicable diseases reported in 1917 accompany this report inasmuch as these tables have not yet been published.

Report of the Bureau of Food and Drugs.

WALTER W. SCOFIELD, JR., CHIEF.

The Bureau of Food and Drugs enforces the laws relating to the production and distribution of milk and milk products (Chapter 78 of the Laws of 1914); the law controlling the pasteurization of milk and its products (Chapter 285 of the Laws of 1915); the law governing the operation of creameries (Chapter 139 of the Laws of 1906); the Slaughter-House act (Chapter 295 of the Laws of 1910); the Cold Storage act (Chapter 101 of the Laws of 1916); the act regulating the sale and breaking of eggs (Chapter 30 of the Laws of 1914); the Methyl Alcohol act (Chapter 286 of the Laws of 1912); the Oleomargarine laws (Chapter 84 of the Laws of 1886 and its supplements) and the Food and Drug act (Chapter 217 of the Laws of 1907) and its amendments and supplements which include the Sanitary act of 1909 and the Non-Alcoholic Beverage act of 1915.

Milk Control—The vital importance of a wholesome milk supply has been recognized and emphasis has been placed on milk control. The supervision of the production and sale of milk throughout the state presents such a large problem that it has been necessary to select certain phases of the work for emphasis. An effort has been made to correlate the work carried on by the different agencies throughout the state in such a manner that duplication of effort would not occur and in order that the producer or distributor would not be confused or antagonized by conflicting orders or regulations. The recommendations made by the Milk Committee of the Central Atlantic States Dairy and Food Officials Association for minimum requirements for a clean and safe milk have been endorsed. The most important factors for such a milk have been considered to be healthy cattle, healthy milkers and milk handlers, a pure water supply, the proper cooling of milk, sterilization of utensils, clean flanks and udders of cows and small top milking pails. On the other hand minor factors which have little or no effect upon the quality of the milk have been minimized.

The possibility of the contamination of milk at dairies, creameries and bottling or distributing stations with the infective material of typhoid fever, scarlet fever, diphtheria, gastro-intestinal infections, septic sore throat or bovine tuberculosis is so great that the general raw milk supply cannot be given the necessary supervision to insure a safe milk. As a result of our investigations, we believe that all milk should be pasteurized, excepting such milk as is produced in conformity with the regulations for the production of "Certified Milk"

as adopted by the American Association of Medical Milk Commissions, or produced under local supervision sufficiently rigid to protect the milk from contamination by pathogenic organisms and to control the sanitary conditions under which it is produced and handled.

Dairy Inspection—In the inspection of dairy premises the State Department of Health has in the past made use of the score card devised by the Bureau of Animal Industry, United States Department of Agriculture. It was apparent that certain essential requirements for the production of a safe milk received little or no attention from the dairy inspector when the score card was used as a guide for the reports of inspections of dairies. As a matter of fact the use of the score card by the average dairy inspector resulted in recording certain numerical figures which he believed the equipment and methods warranted. When it was necessary to take action on such reports in the central office of the State Department of Health, the person attempting to interpret such reports was at a loss to know the actual conditions existing on the dairy from a perusal of the numerical figures recorded, unless the inspector was present to describe the conditions in detail, or unless a supplementary report was made by the inspector. Furthermore, the record made upon the score card was of little value for future reference because it was difficult for the inspector to recall the conditions upon the premises as a result of refreshing his memory by consulting the numerical score. Another objection to the score card is the tendency of certain producers to argue with the official over the score allowed. Such arguments seldom accomplish more than to get the producers in such an antagonistic mood that no beneficial results are obtained.

A more serious difficulty presented itself when it was demonstrated that milk which was not clean was being produced on a dairy which was equipped and operated in such a manner as to receive a high score and, on the other hand, a dairy which had relatively poor equipment produced clean milk.

For these reasons the score card was abandoned and a form was devised for use by inspectors in reporting conditions of dairies. No numerical rating for the equipment and methods employed on dairy premises is made. On the new form the attention of the inspector is directed to the essential points upon which information is desired and reports are made in such a manner that insanitary conditions found are reported clearly.

Recommendations for changes in equipment or methods have been made in written notices from the Department, based upon the reports of inspections. As far as practicable the inspections of dairy premises have been made with representatives of local boards of health and copies of corrective notices have been forwarded to such officials for the purpose of interesting them in milk control work. The inspection of dairies by local authorities with representatives of this Department tends to lessen conflicting orders issued by the different boards. After such joint inspection certain of the local boards of health have made

reinspections of dairies supplying milk within their jurisdiction and have found conditions improved.

Inspections have been made of dairies which supply milk to the following municipalities: Alpha, Asbury Park, Bayonne, Bloomfield, Bound Brook, Dunellen, Dover, Englewood, Freehold, Hackensack, Haddonfield, Hightstown, Hohokus, Keyport, Lakewood, Lambertville, Long Branch, Metuchen, Newton, North Bergen, New Brunswick, Passaic, Paterson, Plainfield, Penns Grove, Princeton, Trenton, Woodbridge.

Inspections have also been made of the dairies supplying milk to creameries at the following places: Andover, Annandale, Belle Mead, Belvidere, Bridgeville, Burnt Mills, Califon, Carteret, Cherryville, Clinton, Delaware, Flagtown, Flemington, Great Meadows, Hixon, Hope, Hopewell, Jutland, Lebanon, Long Valley, Milford, Neshanic, North Branch, Port Murray, Sunnyside, Sussex, Three Bridges, West Portal, Woodruff's Gap.

In addition to the above mentioned work inspections have been made of all dairies located in Cumberland county and Gloucester county. The work of inspecting the dairies in Salem county is now under way.

An effort has been made to inspect dairies, by townships, in certain counties, for the purpose of visiting all the dairies within a given area, regardless of where the milk is sold. This was done in order to inspect dairies which had never been visited in the past. A total of 3,496 inspections have been made of the dairies in this state.

Physical Examinations of Dairy Animals—The State Department is dependent largely upon the reports of physical examinations of dairy animals, made by private veterinarians employed by the dairymen, to gain knowledge of the existence of disease in the dairy herds of this state. Chapter 78 of the Laws of 1914 requires that each dairyman, engaged in the production of milk for sale, shall submit a certificate to the Department of Health of the State of New Jersey, at least once each year, stating the results of the examination of the cows, signed by a duly licensed veterinarian, with reference to the existence of any disease with which the animals may be affected. A compilation of the data contained in such reports received between February 1st, 1918, and June 30th, 1919, shows that 90,484 animals have been examined physically by veterinarians engaged in private practice and of this number only 219 animals were suspected of being affected with tuberculosis. From February 1st, 1918, to July 1st, 1918, private veterinarians reported that they examined 24,069 animals and reported 34 as being affected with tuberculosis. From July 1st, 1918, to January 1st, 1919, the number of animals examined was 19,873 and 67 of these animals were reported as being suspected of being affected with tuberculosis. From January 1st, 1919, to June 30th, 1919, reports of physical examinations of 46,542 animals have been reported and of this number 118 have been suspected of being

DEPARTMENT OF HEALTH.

affected with tuberculosis. Information regarding suspected cases of tuberculosis in dairy animals received by the Department is reported to the Bureau of Animal Industry, New Jersey Department of Agriculture.

The increase in the number of animals which have been physically examined by veterinarians is attributed to the requests for such examinations, which have been made by letter from this Department. The increase in the number of animals reported as being suspected of being affected with tuberculosis is not regarded as a material increase in the number of dairy animals affected with this disease, but is attributed to the fact that local veterinarians are taking greater care to report suspected cases of bovine tuberculosis in dairy animals.

The following table shows the results of physical examinations made of dairy animals by the veterinarian employed by this Department:

CITIES.	Number of Herds.	Number of Cattle.	Number Showing Acute Mastitis.	Abscesses in Udders.	Open Sores in Udders.	Tumorous Growth in Udders.	Abnormal Lymphatic Glands.	Septic Metritis.	Suspected Tuberculosis.	Other Diseased Conditions.	Post Mortem Examinations of Suspected Animals.	Passed for Food.	Condemned as Unfit for Food.	Carcasses Showing Lesions of Tuberculosis.
Bayonne	8	380	1	0	0	3	0	1	6	0	6	2	4	5
Orange	16	322	3	2	6	3	2	0	2	3	2	1	1	2
Newark	37	1,441	8	29	11	8	3	4	15	1	10	6	4	8
Miscellaneous	86	1,164	6	6	6	14	7	2	62	12	53	26	27	53
Totals	147	3,307	18	37	23	28	12	7	85	16	71	35	36	68

By consulting the above table it will be seen that the percentage of advanced cases of tuberculosis among dairy animals is much higher in those herds grouped as miscellaneous. The examinations classed as miscellaneous include herds in practically all sections of the state.

In the cities of Orange and Newark ordinances requiring the tuberculin testing of all cattle supplying raw milk have been in effect for several years. The health officials of these municipalities have supervised the production of milk on the dairies and also the testing of dairy animals to such an extent that the percentage of extensively diseased animals has diminished. In this investigation the cattle which were classed as suspected of being affected with tuberculosis

upon physical examination, in some instances were tuberculin tested and negative results were obtained. In such cases these animals were kept under observation, unless they showed positive signs of tuberculosis by physical examination.

The results of physical examinations of dairy animals supplying milk to the above mentioned municipalities, by the veterinarian employed by this Department, show the need for the frequent examination of dairy animals which supply municipalities with raw milk. It is the intention of this Bureau to continue such investigations of dairy animals supplying raw milk to other municipalities in this state during the coming year.

Creameries and Pasteurizing Plants—The inspection of creameries and milk pasteurizing plants, where large quantities of milk are handled, continues to be one of the important functions of the Bureau. It is a well known fact that pasteurization has had its effect upon the decrease of disease due to milk and upon general improvement of the milk supply, but as opportunities for contamination of milk during the course of pasteurization are common, the necessity of a well organized control of these establishments is obvious. It has not been possible to visit regularly every creamery and pasteurizing plant in the state, but our efforts have been directed chiefly to those plants where poor methods have usually been found.

Where milk is pasteurized, the regulations of the Department require that it be heated to 142-145 degrees F., for thirty minutes, then promptly cooled to a temperature of 50 degrees F., or below. Special stress has been laid on the enforcement of this rule as it is believed to be most important for the efficient operation of a pasteurizing plant. Records must be made each day showing the temperatures to which milk is heated and held in the process of pasteurization and these records must be dated and kept on file, in order that the Bureau may be presented with some evidence of the efficiency of pasteurization at other times than the days on which inspections are made.

The thorough cleansing of vats, pumps, pipes, coolers and bottle fillers, with which milk comes in contact in the course of pasteurization has been insisted upon, as a lack of care in cleansing such apparatus has a harmful effect upon the purity of the milk.

The sterilization of milk cans and containers, especially milk bottles, is a problem that should receive greater attention by the creamery operators. Too often bottles and cans are washed in lukewarm, weak, solutions of alkali, rinsed in warm or cold water and are not sterilized. A blast of steam for a second or two accomplishes little, if anything, in the sterilization of milk containers. Milk that has been properly pasteurized is frequently placed into bottles or cans which have not been sterilized, thereby affording possibilities of contamination.

The requirements that all containers in which pasteurized milk is shipped or delivered shall be tagged, capped or labeled "pasteurized"

and with the day of pasteurization marked on the cap, tag or label, has been more generally enforced. Other matters such as personal cleanliness of creamery employes, clean toilets and washing facilities, screening of doors and windows against flies, suitable covers for milk vats and other receptacles, have been brought to the attention of creamery operators and much improvement has been made along these lines. When neglect in meeting our requirements has been shown, or where serious violations have existed, the operators have been summoned before the Director and a specified time has been granted to them to comply with the law. In two instances, suit was instituted against operators of creameries because they absolutely ignored our recommendations for more careful handling of milk and its products and because they operated their plants without obtaining a license from this Department.

• *Sediment Tests of Milk*—Sediment tests for visible dirt in milk have been made at the time the milk was delivered to the various creameries by the producers. In those tests where the milk showed considerable dirt, the disc was dried and sent to the producer with a notice warning him against the sale of milk which was unclean and advising him to take the necessary precautions to prevent dust, dirt and other foreign materials gaining access to the milk. In certain cases where sediment tests showed unclean milk an inspection was made of the dairy premises where the milk was produced. In most instances conditions or methods were observed which seemed to be responsible for the production of unclean milk, and corrective recommendations were made to the producer. Subsequent tests frequently showed the absence of visible dirt in the milk.

Investigations of the Sale of Milk For Which Special Claims Are Made—The results of investigations regarding the production and distribution of milk for which special claims are made upon the labels or caps of containers, indicate that this phase of the milk control work should receive greater attention from food officials. Such milks are generally sold at an advanced price and, in general, the consuming public purchases the milk with an idea that it is of exceptional quality, or that it is produced under conditions which render it safe. As such milks are generally purchased for infant feeding it is important to make the investigations sufficiently exhaustive to decide whether or not the claims are justified.

One milk for which special claims were made, sold in containers bearing the words "Special Baby Milk," was produced on an ordinary dairy, by animals which had not been tuberculin tested, and no particular care had been exercised in the handling of this milk. In another case milk was labeled "Warranted Guernsey-Jersey Milk" and yet investigation proved that more than one-half of the animals in the herd producing this milk were of other breeds. In other cases milk has been represented as "Certified" or "from tuberculin tested cattle" and it has been ascertained that the claims were false.

Such misrepresentations have been considered violations of the Food and Drug Act and the milks have been regarded as misbranded in that they have been labeled so as to deceive or mislead the purchaser. In each case where the milk was found to be misbranded the matter was taken up with the producer and the violations were corrected.

Certified Milk—During the past year the production and sale of certain milks which have been sold as “Certified Milks” have been investigated. In one case the milk was produced on a dairy located outside of the state and it was certified by a Medical Milk Commission of the state in which it was produced. The certificates on the containers in which this milk was sold were not marked with the day of production as required by Chapter 237 of the Laws of 1909. After two warnings had been sent to the producers of this milk they continued to offer it for sale in violation of the above-mentioned law and suit was therefore instituted against them and the penalty was collected.

In the case of another certified milk produced within the state and certified by a Medical Milk Commission outside of this state, inspection of the dairy proved that certain cows which had diseased udders were kept in the stables with cows which were producing certified milk. It was also found that the milk from the cows with diseased udders was being distributed for food purposes. Such a practice is contrary to the regulations governing the production of certified milk as adopted by the American Association of Medical Milk Commissions, and is also in violation of Chapter 237 of the Laws of 1909. This violation was brought to the attention of the Medical Milk Commission which certifies to this milk and instructions were given to discontinue such practice.

One of the chief objects of milk control is to secure milk which is safe for infant feeding. The sale of milk under false statements as to its quality may result in serious consequences to the health of children. As a result of our investigations it has been decided to rigidly enforce the law with respect to the production and sale of milks for which special claims are made and to make thorough investigations of such milks during the coming year.

Chemical Examinations of Samples of Milk and Cream—4,756 samples of milk and cream have been collected during the period from November 1st, 1917, to June 30th, 1919. Of this number 901 samples were found to differ from the legal standard. The samples which were found to differ from the standard may be divided into the following classes:

Milk deficient in total solids	762
Milk containing added water	123
Skimmed milk not properly marked	2
Cream deficient in fat	13
Milk containing preservatives	1
Total	901

Sanitary Inspections of Food Establishments—Chapter 231 of the Laws of 1909 empowers the State Department of Health and each local board of health, to regulate the sanitary conditions of all establishments where food intended for sale, or distribution, is produced, stored, prepared, or otherwise handled. The impossibility of state-wide enforcement of this law by this Bureau without the aid of the local boards of health is apparent when the large number of retail establishments in the state is taken into consideration. The provisions of this law which deals with retail establishments must be enforced by local boards of health if it is to be effectively enforced. This Bureau has directed most of its attention in the way of sanitary inspections to business houses engaged in an interstate or intrastate business.

The following table shows the number and kinds of establishments where sanitary inspections have been made during the period of time from November 1st, 1917, to June 30th, 1919:

Dairies	3,496
Creameries	830
Milk depots	176
Cheese factories	76
Slaughter-houses	1,709
Canning factories	248
Drug stores	10
Grocery stores	20
Bottling establishments	60
Candy factories	43
Cold storage warehouses	194
Egg breaking establishments	47
Bologna factories	4
Miscellaneous inspections	43

Canning Factories—Each year enormous quantities of certain food products, especially tomatoes, are canned or packed in the State of New Jersey. During the season 248 inspections were made by our representatives of 90 canning factories for the purpose of ascertaining the sanitary conditions under which food products were prepared and also for the purpose of determining the condition of the stock at the time of packing. Representatives of the Bureau of Chemistry of the United States Department of Agriculture accompanied our inspectors on many of their visits to canning factories and rendered material assistance in the work.

In past years certain of the products packed in this state—tomato pulp, paste or tomato catsup—had been condemned and destroyed in large quantities because of the fact that they had been prepared in part from decomposed material. To prevent the destruction of large quantities of foods due to the use of decomposed stock at a time when conservation of foodstuffs was most important, due to conditions brought about by the war, an arrangement was made with the United States Food Administrator for New Jersey whereby

evidence of the use of decomposed stock in the preparation of tomato products would be reported to him by this Department. The Food Administrator agreed that the use of stock which was decomposed in part in the preparation of food products constituted a wasteful practice. The United States Food Administration required all commercial canners to obtain a license to operate their establishments and these licenses were revocable if wasteful practices were followed in the preparation of food products. The operators of canning factories were warned of this ruling of the Food Administrator and in most cases an attempt was made to sort and reject unsound material. In nine instances the proprietors did not heed the warning and were found to be using stock which consisted of decomposed material, in part, in the preparation of food products. On the recommendation of this Bureau they were summoned before the Food Administrator to show cause why the license issued to them by the Food Administration should not be revoked. At this hearing each canner agreed to stop using decomposed materials in the preparation of food products and reinspections showed that the practice had been discontinued.

During our visits to these factories samples of tomato pulp, paste and ketchup were collected for the purpose of determining if these articles contained yeasts, moulds or bacteria in excess of the standards fixed by the regulations of this Department. Of the 104 samples collected, 28 were classed as below the standard.

The usual stress was laid on the sanitary condition of canning factories, especially waste disposal and toilet facilities. The care of the latter is often neglected especially during the height of the season when large numbers of persons are employed. Some toilets were found in a filthy condition with a noticeable absence of washing facilities for employes. The disposal of solid and liquid wastes still constitutes a troublesome problem in some establishments.

The supervision of the canning industry in this state could be more effectively controlled if the operators of canning factories were required to obtain licenses. This would have the effect of eliminating those establishments where the owners refused or neglected to comply with the regulations of the Department. In our opinion the success of the Food Administrator in preventing wasteful practices was largely due to the fact that he had the power to grant and revoke licenses.

Cold Storage—Larger quantities of foodstuffs have been held in cold storage in the warehouses in this state during the period of time from November 1st, 1917, to June 30th, 1919, than at any time in the past. The necessity of preserving enormous quantities of perishable foods near the port of New York, pending the completion of arrangements for its transportation abroad, forced the supply departments of Allied Countries to utilize entire sections of certain cold storage warehouses in this state. During this period large warehouses have been built to meet the demand for space and certain other structures have been converted into cold storage warehouses.

Reports submitted by operators of cold storage warehouses, which are required by Chapter 101 of the Laws of 1916, show that an average of twenty millions of pounds of fresh meats have been held in cold storage on the last day of each month during the past twenty months. On the last day of December, 1918, the reports received from the various warehouses showed over 30,000,000 pounds of fresh meats were held in cold storage. A large proportion of this meat was the property of the Allied Governments and it was stored in the warehouses under the supervision of agents of these governments. The meat was purchased upon specifications and was subjected to rigid inspection.

The Cold Storage act prohibits the storage of articles of food, as defined by that act, for a longer period of time than twelve calendar months except with the consent of the Director of Health. The Attorney-General has ruled that articles of food could be stored twelve months in this state, regardless of the time in other states, provided that further storage would not impair their purity, quality or wholesomeness. It has been found to be a common practice to transfer goods from cold storage warehouses in other states to warehouses in this state and the total period of time the goods are held in storage is often far in excess of the twelve calendar months allowed by our law. It appears that Federal legislation is necessary if this practice is to be stopped.

During the time from November 1st, 1917, to June 30th, 1919, 194 inspections have been made of cold storage warehouses for the purpose of investigating sanitary conditions and to determine whether or not the warehouses are being operated in compliance with the law. Eleven applications have been received for permission to store goods beyond the time limit of twelve months. The action taken with respect to such applications will be found in detail in the report of the Director.

The following table shows the kinds and amounts of foods held in cold storage warehouses on the last day of each month during the period of time from November 1st, 1917, to June 30th, 1919:

You Are Viewing an Archived Copy from the New Jersey State Library

SUMMARY OF ARTICLES OF FOOD HELD IN COLD STORAGE WAREHOUSES IN NEW JERSEY ON THE LAST DAY OF EACH MONTH DURING THE PERIOD FROM THE 1ST OF NOVEMBER, 1917, TO JUNE 30TH 1919.

FOOD AND DRUGS.

81

Egg Breaking Establishments—It has been found that establishments where the breaking of eggs is conducted have been operated in general compliance with the law and regulations governing such places in force in this State. At the present time six establishments are licensed by the Department to break eggs for food purposes. One establishment is licensed to break eggs for manufacturing purposes only.

The business of breaking eggs for food purposes seems to be increasing. Two applications have been received recently for licenses to engage in this business. One of these places is now operating under temporary permission and the other place is in the course of construction.

The following summary gives the names of concerns, addresses and the kind of business for which license was granted, and also the condition of the establishment at the time of the last inspection:

OWNER.	Address.	License Granted to Break Eggs for—	Condition of Establishment.
Great Atlantic and Pacific Tea Co.	Jersey City.	Food purposes only.	Poor, not operating.
Morris Meyer.	Jersey City.	Food purposes only.	Fair.
B. Titman.	Jersey City.	Food purposes only.	Good.
• Droste & Snyder.	Newark.	Food purposes only.	Good.
Swift & Co.	Newark.	Food purposes only.	Fair.
Holcombe & Wilson.	Trenton.	Food purposes only.	Good.
M. Strudler.	Newark.	Food purposes only. Temporary permission.	Fair.
Philip Weber.	Jersey City.	Mfg. purposes only.	Good.

Slaughter-House Inspection—The operators of slaughter-houses in this state are required by Chapter 295 of the Laws of 1910 to obtain a license each year from the State Department of Health to conduct their business. Before an application for a license to operate a slaughter-house is considered the proprietor must obtain the approval of the site from the local health officials within whose jurisdiction the establishment will be located. Such approval when obtained must be submitted to the State Department of Health when application for a license is made. The power to revoke licenses for failure to comply with the law and regulations governing the operation of slaughter-houses, has been an effective means of controlling the sanitary conditions under which the business of slaughtering is conducted. On June 1st, 1919, 236 slaughter-houses were being

operated in this state under a license from this Department. During the time from November 1st, 1917, to June 30th, 1919, 1709 inspections have been made of slaughter-houses by representatives of this Bureau. Our list of licensed slaughter-houses does not include small dealers and farmers who slaughter animals occasionally on farms where the animals are raised.

Meat Inspection—There is no legislation in force in this state requiring the inspection of meat at the time of slaughter, and while sufficient authority is contained in the food law to prevent the sale of diseased meat, it is obvious that no far-reaching results will be obtained until a comprehensive system of meat inspection is in effect. The following table shows the amounts and kinds of meat which have been inspected during the year:

CARCASSES.			PARTS OF CARCASSES.		
	Passed. lbs.	Condemned. lbs.		Passed. lbs.	Condemned. lbs.
Beef	328	64	Beef	9,470	14,730
Hogs	2	Hogs	8,275	80
Calves	426	Calves	535
Sheep	2	Sheep	220
Totals ...	758	64	Totals ...	18,500	14,810

The above mentioned meat inspections were made in conjunction with slaughter-house inspection work and in connection with post mortem examinations of dairy animals which were suspected to be affected with tuberculosis.

Several communications have been received recently by the Bureau from local boards of health throughout the state requesting information regarding the enforcement of that section of the Food and Drug act relative to the sale of immature veal. Officials of the Bureau of Animal Industry, U. S. Department of Agriculture, were consulted in regard to their policy and regulations with respect to the inspection of calf carcasses in establishments under their supervision. The opinion was expressed that the food and care which a calf received had more influence on the development of the animal than the age, and that the weight of calves varied considerably in the different breeds of cattle. Authorities agree generally that the age or weight of calves are not the important factors in determining the suitability of meat for food purposes. It would appear, therefore, that the present section of the food law which prohibits the sale of meat from calves less than four weeks old, at the time of slaughter, be changed to agree with the regulation of the United States Department of Agriculture for guidance in the inspection of veal.

The following table shows the number and kinds of samples of food, other than milk and cream, collected during the period of time from November 1st, 1917, to June 30th, 1919:

<i>Article.</i>	<i>Above Standard.</i>	<i>Below Standard.</i>	<i>Total.</i>

Non-alcoholic Beverages—In 1916 and 1917 a complete survey was made of establishments where non-alcoholic beverages are prepared for the purpose of ascertaining the sanitary conditions of such places. As a result of these inspections notices were sent to the operators of certain plants recommending such improvements as were deemed necessary to cause their establishment to be operated in compliance with the regulations of the Department. Copies of the notices were sent to local boards of health of the municipalities where inspections were made with a request that reinspections be made of the establishments by their representatives. Another survey is now being made in company with local representatives for the purpose of ascertaining

if the operators have complied with our recommendations. In view of the fact that the beverages are consumed largely by the inhabitants of municipalities where they are manufactured, the sanitary inspection of such places seems to be a function of the local boards of health, and we are, therefore, endeavoring to interest local authorities in inspection work along this line. Representatives of this Bureau have collected 310 samples of soft drinks from manufacturers for the purpose of ascertaining whether or not the beverages contained saccharine and other substances prohibited by law. Of this number 28 were found to contain saccharine.

The Bureau of Chemistry, U. S. Department of Agriculture, has ruled that food containing saccharine will be regarded as adulterated. This Department has discouraged the use of saccharine in food products because it has no food value, and further, because the Referee Board has ruled that the continued use of saccharine, even in small quantities, may be injurious to health.

Oleomargarine—The practice of offering oleomargarine for sale in response to requests for butter appears to have been discontinued excepting in rare instances. We attribute the decrease in the number of violations of Chapter 84 of the Laws of 1886 to the rigid enforcement of this act in the past and the extensive advertising of oleomargarine under its true name.

Drugs—The Food and Drug act of this state provides that a drug sold under or by a name recognized in the United States Pharmacopoeia or by the National Formulary, shall be deemed to be adulterated if it differs from the standard of strength, quality or purity laid down in the United States Pharmacopoeia or National Formulary, official at the time of the investigation.

The following table shows the number and kinds of samples of drugs purchased under names recognized by the 9th Revision of the U. S. Pharmacopoeia and by the 4th edition of the National Formulary:

<i>Article.</i>	<i>Above Standard.</i>	<i>Below Standard.</i>	<i>Total.</i>

Patent Medicines—The Bureau has continued the investigation started in 1917 regarding the misbranding of proprietary medicines. The labels and literature used in connection with the sale of several preparations have been found to contain statements which were false and misleading and were therefore misbranded. The misbranding of these preparations took the form of specific therapeutic claims for such diseases as diphtheria, tuberculosis, diabetes, catarrh, asthma, infantile paralysis, syphilis and gonorrhoea. In most cases the misbranding of medicinal preparations was corrected by notifying the manufacturer that the sale of preparations for which false and misleading statements are made constitutes a violation of the Food and Drug act.

As a result of our investigations it is apparent that the statements made in connection with the sale of certain drugs are prepared in such a manner as to comply with the law and at the same time the wording suggests to the average purchaser exaggerated curative properties.

A sample of a proprietary preparation for the treatment of venereal diseases which was manufactured in another state, was collected from a wholesale druggist. This sample was found to be misbranded in that claims were made on the label which were misleading. In view of the fact that the preparation was manufactured in another state the sample and evidence showing inter-state shipment were submitted to the U. S. Department of Agriculture, Bureau of Chemistry.

The dangers to children which are incurred by the use of preparations containing opium and alcohol are well known, and it is therefore suggested that legislation be secured to prohibit the sale of all patent and proprietary preparations which contain any chloral hydrate, opium, morphine, heroin, codiene or any salt derivatives or compounds of any of the above mentioned substances, the labels of which indicate that they are to be used for the treatment of babies or young children.

FOOD AND DRUGS.

87

Methyl Alcohol—Representatives of the Bureau collected 176 samples of toilet preparations from manufacturers, retail stores and barber shops. Only four of these samples were found to contain methyl alcohol. The rigid enforcement of Chapter 286 of the Laws of 1912 has discouraged the use of methyl alcohol in medicinal and toilet preparations in New Jersey and the few samples of preparations which have been found to contain methyl alcohol have been traced to manufacturers outside of the State.

Co-operation—This Bureau has endeavored to co-operate with the Bureau of Chemistry, U. S. Department of Agriculture and collected evidence in inter-state shipments of questionable foods and drugs. We have also worked in co-operation with the various Bureaus of this Department, the New Jersey Department of Agriculture, the various local boards of health of this State, the Dairy Division of the U. S. Department of Agriculture and with the United States Food Administration in matters pertaining to food control work.

Report of George W. McGuire on Ice Cream Factories for 1918.

Following is a report showing the work performed from January 1st, 1918, to December 31st, 1918, in the inspection of ice cream factories.

Four hundred and eighty-nine factories were visited during the year. Four hundred and forty-three were in operation and forty-six had discontinued the business.

There was, approximately, manufactured during the year in the 443 operating factories 3,956,665 gallons of ice cream. It required about 5,275,553 gallons of milk to furnish this output.

As will be seen by the tables below, about one-half of these factories are located in cellars, few of which have proper light and ventilation. When natural light is provided at all, it enters through windows located at the sidewalk end of the cellar opening into an areaway under a sidewalk and covered with an iron grating. These areaways in every instance were found to contain large quantities of dried street dirt, which found its way to the shelves, tables, benches, ledges and other projections in the rooms, and in many cases the containers, machinery and other equipment was defiled by this material.

Letters were sent to proprietors of cellar factories to permanently seal these windows and paint the sash and sills a white color. Many of them objected to carrying out the orders of the Director in this respect on the ground that the State Department of Labor required the windows to be kept open in order to secure sufficient ventilation for the workmen. In order that no conflict of authority through a misunderstanding should occur in the future, an appointment was made with the State Commissioner of Labor for the purpose of arriving at a proper understanding regarding this matter. After a full discussion of the subject the Commissioner concurred in our views and requested that a list of the objectionable factories be sent to him. A list of twenty-six factories was furnished to him and he immediately issued orders to his inspectors to see that all instructions given to ice cream manufacturers by the State Department of Health are obeyed, and promised full co-operation in our future endeavors to safeguard the product.

In a number of cases there has been marked improvement shown, but so long as cellars are permitted to be used for the manufacture of ice cream the danger from this source will exist.

This form of contamination, comprising as it does, human expectations, animal filth, &c., is a serious menace to the purity of a food

product which is eaten in a raw state and it is not unreasonable to suppose that it contains tubercular and other pathogenic germs.

In about two-thirds of the factories the old fashioned tub type of freezer is used; this frequently requires the use of the bare hands to remove the mixture from the metal dasher and from the sides of the cans. After the mixture is frozen the dasher is often laid on a dirty shelf or hung on the wall where it is exposed to dust and fly contamination. The modern type of freezer is of a vertical or horizontal shape connected with brine freezing attachments and so operated that the hands do not at any time come in contact with the mixture, which when frozen is discharged into containers without exposure to the air of the factory.

The cleansing of all containers, utensils and apparatus with which this product comes in contact is a most important detail of the work of an ice cream manufacturer. The larger factories are provided with steam outfits and in most of them live steam is applied, after washing, to all vessels and utensils. These larger factories and a number of the smaller ones are equipped with adequate washing facilities, such as wash vats or suitable sinks in which to wash all vessels and utensils, as well as having ample provisions for heating water. Others, however, have very meagre facilities and the work is not properly done. Each one of these establishments should be provided with sinks and an adequate supply of running hot and cold water.

Where factories have been found to be lacking in proper washing facilities they have been ordered to provide them and in some cases it has been done, but time has not permitted a reinspection of all the places during the year.

The ingredients used in the manufacture of ice cream in this state are received in a pure condition. The formulas for making the commodity varies in the different factories. The most favorite receipt is cream ranging from 16 to 20 per cent butter fat, 33 $\frac{1}{3}$ per cent, whole milk 33 $\frac{1}{3}$ per cent and condensed milk 33 $\frac{1}{3}$ per cent, with the addition of sugar and flavoring or fruit.

Only thirty-four of the four hundred and forty-three dealers use cream exclusively in their product. Commercially cream is the most valuable single ingredient contained in ice cream, costing from 50 cents to 60 cents a pound as against 5 cents to 6 cents for other ingredients.

In fourteen establishments the formula used called for whole milk, cream and eggs or cream and eggs with the addition of sugar and flavoring. This mixture is heated to the boiling point before freezing and is considered to be the best and safest product on the market.

During these inspections each manufacturer was asked a question as to whether the milk products handled by him were pasteurized before using. Two hundred and seventy-one of them answered that they did not know whether they were or not, although in some cases the transportation cans were plainly labeled "pasteurized," indicating that they had been shipped from pasteurizing plants. Thirty-four

ICE CREAM FACTORIES.

91

operators stated that their milk and cream had not been pasteurized and thirty-seven declared that they had ordered and received the pasteurized product.

After visiting these factories and observing the processes of manufacture carried on in them and the indifferent handling of the delicate materials used in the composition of this product, one is impressed with the importance of requiring all milk products used in the preparation of ice cream to be pasteurized.

A few of them have their own pasteurizing apparatus and heat the raw milk and cream to 145° F. before freezing. A few others pasteurize the whole mixture.

Following are the methods pursued by two of the largest manufacturers:

No. 1. "Batch is heated to 145° F. and held 30 minutes. It is then homogenized, next runs over a covered tubular cooler and cooled in a few minutes to 40° F. after which it is placed in a cooling room until ready to freeze.

No. 2. "Cream, milk, gelatine and sugar is placed in a pasteurizer heated to 145° F. and held for 30 minutes. This mixture is then conveyed through sanitary pipes to homogenizer, whence it passes over cooler and the temperature reduced to 40° F. It is then stored in covered vats at the same temperature until ready to freeze. When ready to freeze the mixture is conveyed through sanitary pipes 1¼ inches in diameter, by gravity, to the freezers."

This procedure takes place without exposing the product to the air of the factory and without it coming in contact with the hands of the operator.

The following table shows the kind of equipment, milk products and sanitary condition of the factories inspected:

Number of factories visited	489
Number of factories operated	443
Number of factories out of business	46
Number of factories above ground	222
Number of factories in cellar	220
Number of factories detached buildings	78
Number of factories using tub freezers	341
Number of factories using vertical freezers.....	53
Number of factories using horizontal freezers.....	48

Milk Products Used in Ice Cream in 443 Factories.

Cream, milk, condensed milk	276
Cream	34
Cream and milk	49
Cream, condensed milk, milk powder	9
"Ice cream powder"	1
Cream, condensed milk	57
Milk, cream, eggs	14
Milk, cream, starch	1
Milk, cream, condensed milk, milk powder	1
Butter, milk, cream, condensed milk	1

Answers to Question as to Whether Milk Products Were Pasteurized.

"Yes"	37
"No"	34
"Don't know"	271

List Showing the Nature of Insanitary Conditions During the Year.

- Yard adjacent to factory unclean, open privy unprotected.
- Inadequate washing facilities.
- No draining racks for cans and utensils.
- Products manufactured in kitchen of dwelling.
- Insanitary pipes.
- Congestion of non-essential articles including clothing, shoes, garbage and rubbish.
- Accumulation of street dirt on shelves, sills, ledges and other projections.
- No proper wash vat.
- An abundance of flies.
- Floors, walls, shelves and ledges dirty.
- Open privy unprotected 5 to 20 feet from factory.
- Yard unclean, chickens in yard, flies in factory, bad odors, factory unscreened.
- Insanitary toilet in factory.
- All surfaces unclean, no screens, no washing facilities.
- Wood floor, surplus non-essential articles, products exposed to dirt, no racks, place in disorder.
- Factory in disorder, storage of non-essential articles, pigpen within 50 feet.
- Surfaces all dirty, cellar steps and space beneath unclean. No racks.
- Unclean sink.
- Defective floor drainage.
- Sleeping quarters in mixing room.
- Filth under ice boxes.
- Meat, vegetables and groceries in unclean factory.
- Milk cans used for other substances than milk.
- Bad odors from catch basin.
- No natural light or ventilation.
- Floor drainage through holes to ground beneath. Family washing in factory.
- Factory room used for storage of bedding and bedroom furniture recently removed from deceased influenza victim.
- Interior of large refrigeratory thickly covered with moulds.

Report of Bureau of Engineering.

H. P. CROFT, CHIEF.

The decrease in the personnel of the Bureau produced by the men volunteering for service in the United States Army has seriously affected the work of the Bureau. Due to the insufficient appropriation and lack of sanitary engineers, it was impossible to fully carry on the work assigned, and only those inspections and investigations of most importance to the public health were attempted.

On May 28th, 1918, as a result of these conditions, the Department adopted the following resolution:

"That until further notice, the Department of Health of the State of New Jersey finds it necessary to cease investigating pollutions of the potable and unpotable waters of the state, and will not prosecute such cases unless they are shown to be injurious to the health of the inhabitants of this state, or unless complete evidence, suitable for the prosecution of the case, is presented to the Department by the complainants."

The Bureau has in the past endeavored to maintain a fairly uniform schedule, whereby each sewage and water treatment plant received four or more inspections each year. This schedule could not be maintained. Due to the drought during the summer months of 1918, the lack of water in reservoirs and streams throughout the state reached the most critical stage known in years. The request from those in charge of the various water plants for assistance on account of the necessary use of emergency supplies became so numerous that only the plants that absolutely required temporary supervision and advice were visited.

Duties of the Bureau—The work of the Bureau covers the following main divisions: The examination of plans for proposed water and sewage treatment works; the inspection of the operation of water and sewage treatment works; the investigation of stream pollution from industrial trade wastes and domestic sewage; the inspection of watersheds from which potable water supplies are derived; and, the investigation of complaints.

The following tabulation shows the per centum of the time required for the performance of the work of the Bureau since the end of the fiscal year of 1917:

	Nov. 1, 1917 to June 30, 1918 ¹	July 1, 1918 to June 30, 1919
Examination of plans and replying to correspondence	15.0	12.1
Routine investigation of public water supplies..	6.5	6.6
Special investigation of public water supplies..	7.8	6.1
Routine investigation of sewage treatment works	10.5	6.3
Special investigation of sewage treatment works	9.9	13.9
Special investigation of stream pollution by industrial trade wastes	4.9	11.4
Inspection of watersheds from which potable water supplies are derived.....	1.1	6.0
Investigation of complaints relating to pollution of streams not used as potable water supplies	3.3	4.1
Analyzing samples, writing reports, &c.....	30.0	24.02
Court cases, collection of water samples, including those for railroad certification, &c.....	11.0	9.5

AT THE FOLLOWING PLACES SEWAGE TREATMENT PLANTS ARE UNDER
CONSTRUCTION OR HAVE BEEN CONSTRUCTED.

AMATOL (Atlantic Loading Company):—On September 3d, 1918, plans were approved for a sanitary sewer system and a sewage treatment plant consisting of the following units: A one-story sedimentation tank, a dosing tank, and five sand filtration beds. The plans were approved with the proviso that a sludge drying bed will be constructed when required. The effluent is discharged into Lucas creek, a tributary of the Mullica river.

BOONTON (E. A. Stevenson Company):—On January 14th, 1919, plans for the treatment of industrial wastes were approved. The plant consists of a grit chamber, grease traps, aerating tanks, sedimentation tanks, and sludge lagoons. The effluent is discharged into the Rockaway river.

BORDENTOWN (Industrial School):—On July 2d, 1918, plans were approved for a one-story sedimentation tank with two compartments, and a sludge drying bed. The effluent is discharged into the Delaware river.

CAMDEN (Yorkship Village):—On September 17th, 1918, plans were approved for a sanitary sewer system and a sewage treatment plant. The effluent is discharged into the Newton creek.

CAMP DIX:—On November 13th, 1917, plans were approved for a sewage treatment plant consisting of the following units: A one-story sedimentation tank with two compartments, each 20 feet in width, 80 feet in length, and 14½ feet in average depth; a dosing tank, with a capacity of 3,650 gallons; and a sprinkling filter with an area of 1.08 acres and 5½ feet in depth. The plans were approved with the proviso that secondary settling tanks will be constructed when required. The effluent is discharged into the South Branch of the Crosswick's creek.

CAMP MERRITT:—On November 13th, 1917, plans were approved for a sedimentation tank, with a capacity of 290,000 gallons, with the proviso that a sprinkling filter and a secondary settling tank will be constructed when required. The effluent is discharged into the Hackensack river.

COLONIA (U. S. Base Hospital):—A sewage treatment plant was constructed consisting of the following units: A rectangular sedimentation tank, with a capacity of 64,000 gallons; a dosing tank, with a capacity of 1,140 gallons; a sprinkling filter, with an area of .164 acres and 5½ feet in depth; and two "Humus" tanks, each 5 feet in width, 15 feet in length, and 4 feet in

depth. Plans were not submitted for action. The effluent is discharged into the Rahway river.

EWING TOWNSHIP (Agasote Millboard Company):—On January 14th, 1919, plans were approved for an industrial waste treatment plant. The effluent is discharged into Gold run, a tributary of the Delaware river.

KEARNY (Federal Shipbuilding Company):—On December 4th, 1917, plans were approved for nine one-story sedimentation tanks. The plans were approved with the proviso that additional units for the purification of the sewage will be installed when required. The effluents are discharged into the Newark bay.

KENTWORTH (American Can Company):—On April 2d, 1918, plans were approved for a sewage treatment plant consisting of a two-story sedimentation tank, a dosing tank, two sand filtration beds, and a sludge drying bed. On May 7th, 1918, amended plans were approved. The effluent is discharged into the Rahway river.

KENVIL (Hercules Powder Company):—On September 3d, 1918, plans were approved for a sewage treatment plant consisting of a one-story sedimentation tank, a dosing tank, and two sand filtration beds. The effluent is discharged into Black river.

LITTLE SILVER (Camp Vail):—Two sewage treatment plants were constructed at this camp. The plans were not submitted for action. The effluent is discharged into a tributary of the Raritan bay.

METUCHEN (Camp Raritan):—A sedimentation tank was constructed, the plans for which were not submitted for action. The effluent is discharged into a tributary of the Raritan bay.

METUCHEN (Woodbrook Farm):—The sewage treatment plant is now in operation. The effluent is discharged into a tributary of the Raritan bay.

MIDLAND TOWNSHIP (Home of Divine Providence):—On May 13th, 1919, plans were approved for a one-story sedimentation tank with two compartments, each 7 feet in width, 14 feet in length, and 7 feet in depth; a dosing tank, with a capacity of 600 gallons; and three sand filtration beds, 20 feet by 60 feet, and 3 feet in depth. The effluent is discharged into Hobokus creek.

NEW LISBON (Burlington County Tubercular Sanatorium):—On November 13th, 1917, plans were approved for a sewage treatment plant consisting of the following units: A one-story sedimentation tank with two compartments, each $4\frac{1}{2}$ feet in width, 12 feet in length, and $5\frac{1}{2}$ feet in depth; a dosing tank, with a capacity of 500 gallons; and two sub-surface irrigation fields, each field contains 2,000 feet of 3-inch farm tile.

NOREG (Emergency Fleet Corporation):—On February 4th, 1919, plans were approved for a sanitary sewer system, a pump station, and a sewage retention tank, with the proviso that works for the purification of the sewage discharged will be constructed when required. The effluent is discharged into the Delaware river.

PLAINFIELD:—On March 5th, 1918, plans were approved for additions to the sewage treatment plant. The plans call for the installation of a Reinsch-Wurl Screen, 10 feet in diameter with $\frac{1}{16}$ -inch slots; and a sludge drying bed, with an area of 5,400 square feet.

POMPTON LAKES (E. I. du Pont de Nemours & Company):—On May 7th, 1918, plans were approved for alterations and additions to the sewage treatment plant.

RED BANK:—The additional sedimentation tank is now in operation. The effluent is discharged into the Navesink river.

ROEBLING:—On July 2d, 1918, plans were approved for alterations to the sanitary sewer system, and for a sewage pumping station.

SAYREVILLE TOWNSHIP (Gillespie Loading Company):—On July 2d, 1918, plans were approved for a sewage treatment plant. The effluent is discharged into a tributary of the Cheesequake creek.

WAYNE (E. I. du Pont de Nemours & Company):—On May 28th, 1918, plans were approved for a sewage treatment plant consisting of the following units: A sedimentation tank with two compartments, each 5 feet in width, 8 feet in length and 8 feet in depth; a dosing tank; and a sprinkling filter, with an area of .014 acres and 6 feet in depth; a secondary sedimentation tank; and a manual control direct feed chlorinator. The effluent is discharged into the Pompton river.

WANAQUE (Wanaque River Paper Company):—On September 17th, 1918, plans were approved for two sewage treatment plants, each to consist of a one-story sedimentation tank and sub-surface irrigation fields. An experimental plant for the treatment of industrial wastes has been installed.

WRIGHTSTOWN:—On April 2d, 1918, plans were approved for a sewage treatment plant consisting of the following units: A one-story sedimentation tank with three compartments, each $8\frac{1}{2}$ feet in width, 20 feet in length, and 6 feet in depth; and two sand filtration beds, each 75 feet by 90 feet, and 3 feet in depth. The effluent is discharged into the North Branch of the Crosswick's creek.

Water Treatment Plants—In this state there are 68 water treatment plants, and 19 plants using chlorine as the only method of purification. A minor portion of the water filtration plants, and only four of the chlorination plants, are under expert technical supervision. At plants where surface waters are treated or purified, the variations in the quality of the raw water require changes in the amounts of chemicals or disinfectant added, and in order to make these required changes chemical analyses and bacteriological examinations should be made at least daily. The operation of these plants without expert supervision means that the burden is placed upon this Bureau, and it is impossible with the limited personnel to determine whether or not a water safe for potable purposes is being secured at all times.

The following table, No. 12, shows the total number of water treatment plants in operation, with information as to the tests made at these plants:

TABLE NO. 12.—TYPE OF WATER TREATMENT PLANTS.

TYPE OF WATER TREATMENT PLANTS.	Total Number of Plants.	Number of Plants Making Daily Determination for—					Number of Plants Making Weekly or Monthly Determination for—		Name of Company or Municipality Making Test.	Determination Made, Number.

Sewage Treatment Plants—The restrictions placed upon bond issues and the difficulty of securing priority of orders during the war prevented the construction of sewage treatment plants in many municipalities. Even with these restrictions, however, 27 plants have been constructed since November 1st, 1917, and there are now 264 sewage treatment plants in operation as a protection to the waters of this state.

There are four reasons for the maintenance of these sewage treatment plants: First, for the protection of potable water supplies; second, for the protection of shellfish areas; third, for the protection of bathing beaches; and, fourth, for the prevention of nuisances, which may cause actual damage to property or inconvenience to the inhabitants of the community.

The following tables, Nos. 3, 4, 5, 6 and 7, contain information in regard to the sewage treatment plants:

TABLE NO. 3.—SEWAGE TREATMENT PLANTS IN NEW JERSEY.

Sewage Treatment Plants at Army Camps—The sewage treatment plants installed in the various army camps in the state have not given satisfactory service. This was due to one or more of four factors: poor design, poor construction, inefficient operation or overloading. The last factor was the most important in producing these results, as in several instances the plants were overloaded to much more than twice their rated capacity, due not only to the enlargement of the camps but also to the fact that the theoretical water consumption from which the sewage flows were calculated for the design was exceeded in practice by as high as 100 per cent. Officers and men unskilled in the operation of sewage treatment plants were placed in charge. Plants were designed and built with no provision for sludge removal or disposal, so that when the tanks were clogged with sludge, the operator either dumped the sludge into the stream, which the plant was supposed to protect, or by-passed the raw sewage around the tanks. Later, after some delay and discussion, some of these plants were improved by much needed enlargements and additions, and it is hoped that these improvements will result in the production of satisfactory effluents.

Industrial Wastes—The number of inspections required by the pollution of streams from industrial wastes are increasing yearly. Throughout the state the practice at most manufacturing plants is to discharge untreated wastes into a convenient stream, regardless of whether or not it impairs the value of the water. The result in nearly every instance is the creation of a nuisance, and sometimes of conditions believed to be detrimental to the public health. To encourage experimental investigations in the treatment of industrial wastes, the Laboratory of Hygiene and this Bureau have co-operated with manufacturers by making chemical analyses and bacteriological examinations of both raw and treated wastes, the samples being collected at the experimental plants installed by the interested companies.

The growing importance of the trade waste disposal problem warrants the appropriation of a special fund for research work in this field.

The Examination and Licensing of Superintendents and Operators in Charge of Water and Sewage Treatment Plants—Many of the sewage treatment plants in New Jersey are not functioning properly, and most of these plants have deteriorated as a result of unskillful and careless operation, which has already imposed upon some of the owners of the works expenditure of funds for repairs and replacements which would not have been necessary were the plants properly supervised.

Stream pollution throughout the state is increasing steadily, so that water treatment plants which were delivering a satisfactory water for potable purposes in the past may be delivering a dangerous water in the near future, due to this increased pollution. This additional burden placed upon these plants necessitates more careful supervision.

In order that the interested parties may secure the results for which the works were designed and the moneys invested, the following act was passed by the Legislature of 1918:

CHAPTER 23, LAWS OF 1918.

An Act to provide for the examination and licensing of superintendents and operators in charge of water purification or treatment plants and sewage treatment plants under the direction of the Department of Health of the State of New Jersey.

BE IT ENACTED *by the Senate and General Assembly of the State of New Jersey:*

Examination
of operators.

1. In order that municipalities, corporations or individuals owning or operating water purification or sewage disposal plants may secure the services of capable superintendents or operators, the Department of Health of the State of New Jersey is hereby authorized to cause examinations to be made, by such persons and at such times and places as it may appoint and under such rules and regulations as it may adopt, for the purpose of determining the qualifications of applicants for licenses as superintendents or operators in charge of any water purification or treatment plants purifying or treating water used for potable purposes by this State or of any sewage treatment plants discharging an effluent into any of the waters of this State. Every such examination shall be in such subjects and conducted in such a manner as the Department of Health of the State of New Jersey shall direct, and every applicant whose examination shall be approved by said department shall receive a license as superintendent or operator of public water treatment plants or public sewage treatment plants, as the case may be.

License.

Operator
must be
licensed.

2. No municipality, corporation or individual shall appoint any person as superintendent or operator in charge of any water purification or treatment plant purifying or treating water used for potable purposes by inhabitants of this State or of any sewage treatment plant discharging an effluent into any of the waters of this State, or permit any person to discharge the duties of superintendent or operator in charge of such plant who is not the holder of a license issued by the Department of Health of the State of New Jersey under the provisions of this act; *provided, however,* that nothing herein contained shall prevent any municipality, corporation or individual from continuing in office any person now occupying the office of superintendent or operator in charge of any water purification or treatment plant or any sewage treatment plant, and the Department of Health of the State of New Jersey, upon

Proviso.

Continuance
of present
operators.

BUREAU OF ENGINEERING.

115

certification from the proper municipal officer, corporation or individual, that such person held the office of superintendent or operator in charge of such water purification or sewage treatment plant at the time this act became effective, shall issue a license to said person in the same manner as if he had passed an examination held by the aforesaid department.

3. The Department of Health of the State of New Jersey may revoke the license of any superintendent or operator in charge of any water treatment or sewage treatment plant if, after a hearing held by said department at which said superintendent or operator shall have had an opportunity to be heard, either in person or by counsel, said department shall determine that the said superintendent or operator in charge is incompetent to manage said plant, or that he has wilfully neglected his duty in supervising the operation of said plant, or that he has disregarded or disobeyed the lawful orders, rules or regulations of said department.

Revocation
of license.

4. Any person who shall violate any of the provisions of this act shall be liable to a penalty of ten dollars for each day on which such violation has occurred. All penalties prescribed by this section shall be recovered in an action of debt by and in the name of the Department of Health of the State of New Jersey as plaintiff.

Penalty for
violation.

5. All penalties collected under the provisions of this act shall be paid into the treasury of the State of New Jersey.

Penalties paid
into treasury.

6. Whenever any municipality, corporation or individual shall violate any of the provisions of this act, it shall be lawful for the Department of Health of the State of New Jersey, either before or after the institution of proceedings for the collection of the penalty imposed by this act for such violation, to file a bill in the Court of Chancery, in the name of the State, at the relation of such department, for an injunction to restrain such violation and for such other or further relief in the premises as the Court of Chancery shall deem proper, but the filing of such bill, or any of the proceedings thereon, shall not relieve any party to such proceedings from the penalty or penalties prescribed by this act for such violation.

Restraining
violations by
injunction.

7. All acts and parts of acts inconsistent with the provisions of this act are hereby repealed.

8. This act shall take effect immediately.

Repealer.

Approved February 9, 1918.

Report of the State Laboratory of Hygiene.

R. B. FITZ-RANDOLPH, CHIEF.

The following report deals with the work of the Laboratory of Hygiene for the period beginning November 1st, 1917, and ending June 30th, 1919. The work of the laboratory falls in three classes: the examination of specimens from suspected cases of communicable diseases, the analysis of samples of food and drugs for the purpose of determining whether or not the food and drugs act is being violated, and the analysis of samples of water and sewage.

Bacteriological Laboratory—Detailed descriptions have been given in previous reports of the work done in this branch of the laboratory and therefore but brief mention is made of it here. The tables which follow show the kind of examinations made, and it will be seen from the table of miscellaneous examinations that the work is quite varied, including the examination of specimens from practically all bacterial infections encountered in this climate which relate in any way to the public health.

Outfits for the collection of these specimens are obtainable at numerous repositories located in different cities and towns throughout the state, except outfits for the collection of specimens for special examinations, which are supplied to physicians on request direct from the laboratory.

The laboratory is frequently blamed by physicians for delays in reporting the results of examinations of specimens when these delays are due to causes over which we have no control. Every effort is made to examine and report upon all specimens in the shortest time consistent with accurate work. Some varieties of specimens require a longer time than others to examine, which fact is not always appreciated by physicians.

The principal cause of delay is in the transmission of specimens to the laboratory through the mails. This is usually due to one of two causes; delays in mailing specimens or delays in delivery by the postal authorities. Because of ignorance on the part of postmasters, many specimens are improperly forwarded with parcels post matter. The Postal Regulations require that specimens for bacteriological examination must be pouched with letter mail although they may be mailed at parcel post rates. A statement to this effect is plainly printed on the outer wrapper of each mailing case supplied by the

laboratory but is frequently ignored by postmasters, especially those in the smaller towns. If these regulations were called to the attention of postmasters by physicians at the time of mailing specimens, much unnecessary delay would be avoided.

Physicians frequently entrust the mailing of specimens to other persons who neglect to mail them promptly. Cases have occurred in which the doctor has telephoned the laboratory for a report on a specimen, only to find that it has not yet been received, and upon investigation, has found that it has not been mailed by the person to whom he gave it.

During the period covered by this report a considerable number of specimens were received bearing no marks to show by whom they were sent. In many cases even the postmark is undecipherable. It is, of course, impossible to report upon such specimens although they are invariably examined in the hope that the information will be supplied later.

It is important that specimens be prepared in accordance with the directions accompanying the mailing cases provided by the laboratory. This insures an early report and frequently avoids the necessity of collecting another specimen.

Attention is called to the fact that Wasserman tests are made only on Wednesday and Thursday of each week. It is very desirable that physicians collect their specimens early enough to enable them to reach the laboratory not later than Wednesday night. If this is not done it is necessary to hold them until the following Wednesday.

Many physicians do not yet understand that these specimens are not examined every day and complain about what seems to them to be an unnecessary delay in making reports. Under present conditions it is not possible to make these examinations more frequently. This cannot be done until the laboratory staff is increased and less crowded quarters are available.

It is most important that specimens of blood for Wasserman tests be collected exactly as directed on the slip accompanying the outfit. Unless this is done, unsatisfactory results can hardly be avoided.

The following table shows the number of specimens which have been examined in the laboratory each year since it was established, It also shows how rapidly the number of Wasserman tests has increased. With the extension of the work of the Bureau of Venereal Disease Control, this increase should be much greater during the coming year.

STATE LABORATORY OF HYGIENE.

The following table shows the number of outfits supplied to repositories maintained throughout the state and to physicians who are not conveniently located near repositories, from July 1st, 1918, to June 30th, 1919, inclusive:

Diphtheria—Regular outfits	8,196
Serum tubes and swabs	2,664
Extra swabs	3,459
Total	14,319
Tuberculosis outfits	8,332
Typhoid fever outfits	3,238
Malaria outfits	913
Gonorrhoea outfits	2,206
Syphilis outfits	5,604
Faeces and urine outfits	226
Silver nitrate outfits	620
Total	35,458

Chemical Division—All chemical work with which the Department may have occasion to deal is handled by this Division. Such work includes the analyses of food and drug samples submitted by the Bureau of Food and Drugs, and the examination of water, sewage and trade wastes collected by the Bureau of Engineering, together with certain other miscellaneous samples requiring special analyses or research.

During the war period considerable time was spent in the examination of various food substitutes, at the request of the State Food Administrator, together with the analyses of other products to which deleterious substances were alleged to have been added. In one sample of oat meal arsenic was found in appreciable quantities, and in one specimen of chocolate, Paris green was detected. In these two cases the information obtained was referred to the Department of Justice for investigation. In addition to making the examinations above mentioned, investigations are conducted of various chemical manufacturing plants to determine if these plants emit into the air odors and fumes in sufficient quantities to produce nuisances deleterious to the public health.

During the past twenty months the work of compiling the routine analytical methods in use in the laboratory has been begun, it being the aim to obtain a comprehensive set of working methods, and thus to secure greater uniformity in the analytical procedure of the laboratory working force.

The laboratory work relating to the examination of trade wastes has indicated more clearly than ever before the necessity of more careful study and more detailed work in relation to these wastes. While much of the investigation looking toward the solution of the disposal of factory wastes is an engineering problem, in many cases complex chemical difficulties present themselves. The laboratory can be of little use toward solving these problems if its work is to

be confined solely to the examination of miscellaneous trade wastes submitted from time to time by the Bureau of Engineering, and upon which a limited number of routine analytical determinations are made.

The following table shows the number and character of the samples examined:

FOODS.

CHARACTER OF SAMPLE.

During the last canning season the laboratory collaborated with the Committee on standards on certain work relating to tomato products. The tomato pulp now on the market varies from unconcentrated strained tomatoes to the product obtained by concentrating strained tomatoes to one-third of their volume. One of the objects of the investigations was to obtain data pertaining to the total solids content and specific gravity of tomato pulp of known history. It is hoped that it will be possible to eventually bring about a condition in the canning trade so that all tomato pulp packed will be prepared to meet a fixed specific gravity. The following table shows results of analyses of samples of pulp of known history:

STATE LABORATORY OF HYGIENE.

Trade wastes	199
Sand	32
Miscellaneous samples	15
Totals	4,051

Early in 1918 a limited number of tests were made to compare the use of Eosin-Methylene-Blue Agar¹ with Endo's Medium as a confirming medium for members of the B. Coli group. The results of examinations of 254 broth cultures from potable waters show that over 97 per cent gave parallel results on the Eosin and Endo Agars. The growth of colonies on the Eosin Agar was usually more typical than on the Endo Agar, and exhibited a fewer number of doubtful plates. The above confirmations indicate that, using the Eosin Agar as a confirming medium for B. Coli of fecal origin, slightly more than 1 per cent of the Endo positive cultures were of non-fecal origin. Very satisfactory growths were obtained on both Media. Owing to the pressure of work due to the war it was not found possible to continue the investigation to an extent which would warrant the drawing of definite conclusions.

Number of broth cultures examined	254
Number of cultures Pos. on Endo A.....	164
Number of cultures Pos. on Eosin A.....	161
Number of cultures Neg. on Endo.....	90
Number of cultures Neg. on Eosin A.....	93
Number of doubtful Endo plates	3
Number of doubtful Eosin plates	1
Number of cultures Pos. on Endo A. and Neg. on Eosin A.....	3

Shellfish—Oysters and clams are the shellfish most commonly used as food, and since the majority are almost always eaten in an uncooked or partially cooked condition, it is important that they shall be produced under such conditions as will render them safe for human consumption. The work of supervision has consisted in making sanitary surveys of the watersheds adjacent to the oyster beds and floating grounds, and bacteriological examinations of the shellfish and of the waters from which they are collected.

Maurice River Section—The total number of water samples collected from the Maurice River was three hundred sixty-five. These samples were collected at various points between Long Reach and the Main Street Bridge at Millville. The bacteriological results were as follows:

Section Four.

Number of samples collected	50
Number showing B. Coli present in 1 c.c.....	43=86%
Number showing B. Coli present in .1 c.c.....	22=44%
Number showing B. Coli present in .01 c.c.....	7=14%
Number showing B. Coli absent	7=14%

In Section Three which extends from a point approximately two miles below the sewage disposal plant to about a mile north of Manumuskin, fifty samples were collected. The results of these samples were as follows:

Number showing B. Coli present in 1 c.c.....	40=80%
Number showing B. Coli present in .1 c.c.....	10=20%
Number showing B. Coli present in .01 c.c.....	3=6%
Number showing B. Coli absent	46=20%

In Section Two which includes Manumuskin Creek and extends to a point just above Leesburg, fifty samples were collected with the following results:

Number showing B. Coli present in 1 c.c.....	25=50%
Number showing B. Coli present in .1 c.c.....	7=14%
Number showing B. Coli present in .01 c.c.....	2=4%
Number showing B. Coli absent	25=50%

STATE LABORATORY OF HYGIENE.

129

From Leesburg to the northern end of Long Reach fifty samples were collected, with the following results:

Section One.

Number showing B. Coli present in 1 c.c.	27=54%
Number showing B. Coli present in .1 c.c.	6=12%
Number showing B. Coli present in .01 c.c.	1= 2%
Number showing B. Coli absent	23=46%

In Long Reach ninety samples were collected on ebb tide and sixty on flood tide. The bacteriological results obtained on these samples were as follows:

Long Reach, ebb tide.

Number of samples collected	90
Number showing B. Coli present in 1 c.c.	51=56.6%
Number showing B. Coli present in .1 c.c.	14=15.5%
Number showing B. Coli present in .01 c.c.	1= 1.1%
Number showing B. Coli absent	35

Long Reach, flood tide.

Number of samples collected	60
Number showing B. Coli present in 1 c.c.	14=23.2%
Number showing B. Coli present in .1 c.c.	2= 3.3%
Number showing B. Coli present in .01 c.c.	1= 1.83%
Number showing B. Coli absent	46=76.6%

Fifteen other samples in addition to those collected in Long Reach were taken from the oyster floats at various places on both sides of the river during ebb tide. The bacteriological results obtained on these samples were as follows:

Number of samples collected	15
Number of samples showing B. Coli present in 1 c.c.	12
Number of samples showing B. Coli present in 0.1 c.c.	3
Number of samples showing B. Coli present in 0.01 c.c.	0
Number of samples in which B. Coli was not detected.....	4

One hundred ninety-seven samples of oysters were collected of which forty were salt and one hundred fifty-seven floated for various lengths of time. The results of the examination of these samples follow:

Salt Oysters.

Number of samples of salt oysters examined	40
Number of samples having a score under 23.....	39=97.5%
Number having a score between 23 and 50.....	1= 2.5%

Floated Oysters.

Number of samples collected	157
Number having a score under 23	138=88%
Number having a score between 23 and 50	14= 8.9%
Number having a score above 50	5= 3.1%

The following table shows the score of salt oysters taken from various parts of the Maurice River Cove, and the score of the oysters of the same lot after having remained in the waters of the Maurice River for varying lengths of time.

Salt Oysters		Floated Oysters	
Score	Time Floated	Oyster Score	
0-0-3-1-0-0-0-1	2 low waters	4-4-4-14-1-2-4-3-0-1-3-5	
1-2-1-0-3-3-2-1-2-2-4-4	4 " "	5-4-5-23-15-5-3-14-14-4	
4-3-14-4-14-23-14-5-2-3-2-0	6 " "	5-14-14-5-14-14-3-4-32-4-4-14	

The sanitary surveys made in this section indicated that the possibility of pollution of the river in the vicinity of the oyster floats by substances of human origin could be regarded as negligible.

The Millville Sewage Disposal Plant is now under laboratory control. Daily tests of the raw and treated sewage are made by the city engineer for the purpose of controlling the amount of chlorine to be added to the effluent in order to secure satisfactory disinfection. The results of his findings are submitted to the Department weekly. The plant has been discharging an effluent which it is now believed will no longer be a detriment to the shellfish business at Bivalve and Maurice River.

Atlantic City—During the period extending from June until September 1st, with the co-operation and assistance of the Health Officials of Atlantic City, an almost continuous patrol was maintained of the waters in the vicinity of Atlantic City previously condemned by the Department.

The main purpose of the work during the time above mentioned was to prevent the gathering and distribution of clams from the grossly polluted thoroughfares near Atlantic City, Ventnor, Margate City and Longport. The work was marked by the helpful aid of the Federal Food Administrator of Atlantic County, and the State Food Administrator, both of whom presided at a public hearing at which a considerable number of persons engaged in the clamming business

had been cited to appear to explain why they were violating the law by collecting clams from polluted waters. At the hearing the clambers present were severely reprimanded, and at its conclusion the matter was given wide publicity in the local newspapers. Despite personal warnings, persuasion and publicity it was found impossible to induce a large number of the clambers to discontinue the gathering of clams from the polluted areas. It became necessary, therefore, for the Department to adopt more vigorous methods, as a result of which a number of the clambers have been prosecuted for the collection of the penalty provided by law and convictions secured. This method will be followed in the future in so far as it is possible with the limited force the Department has available for this work.

Tuckerton—The sanitary survey of Tuckerton Creek made during the month of August showed that certain pollutions which had formerly existed resulting in the pollution of the stream had been abated. No oysters were being floated at the time of the investigation, but the survey indicated that the creek should now be a more satisfactory place for the purpose of floating and storing oysters than heretofore.

West Creek—This stream is a tributary of Little Egg Harbor Bay, and is navigable to the oyster wharves of West Creek, a distance of three miles. Ten samples of water were collected, immediately after a heavy rain, the *B. Coli Communis* being present in dilutions of 1 cubic centimeter in nine per cent of the samples examined. This stream is practically free from dangerous pollutions, only one minor contamination being noted.

NEW JERSEY STATE LIBRARY

Report of the Division of Child Hygiene.

JULIUS LEVY, M.D., CONSULTANT.

It appears that prior to my association with the Division the work consisted principally in showing the child hygiene exhibit in various communities, together with a number of lantern slides and motion picture films on health, and giving lectures on child hygiene subjects.

In September, when I became associated with the Department there was available for the rest of the year approximately \$15,000. We decided that it would be best to recall the exhibit on account of the large expense attached to its transportation, and to concentrate upon placing nurses in the communities where the need for preventive child hygiene work was very great, as evidenced by the high infant mortality rates and the total absence of preventive child hygiene work. To carry out the new plans it became necessary to reorganize the entire Division, which was then divided into four divisions, with a Supervisor for each.

The first Division was to deal with the placing, instruction and supervision of the nurses, whether they were in the employ of the State Department, or private society or municipality. Of course where the nurse was not in state employ, this supervision could only be given upon the approval of the employing body. Twelve nurses have been placed in seven counties: Burlington, Camden, Gloucester, Mercer, Middlesex, Salem and Warren. Baby Keep-Well Stations have been opened in the following cities: Burlington, Mt. Holly and Riverside; Camden, Paulsboro, Trenton (2); Chrome, Perth Amboy and New Brunswick; Penns Grove and Phillipsburg. Three nurses employed by private organizations in Passaic and Salem and Rahway, are under state supervision.

The second Division was assigned the task of studying the midwifery situation in the State of New Jersey for the purpose of determining the degree and nature of supervision that would be required to elevate the standard of midwifery practice, and thereby protect maternal and infant life.

The study of the midwifery situation in Mercer, Essex and Hudson counties has been completed, and on these studies it has been determined to divide the state into eight districts, and to place an Assistant Supervisor of Midwifery in charge of each district, whose function it will be to become intimately acquainted with the character of practice carried on by each midwife, and through education, cooperation and demonstration to improve the character of their work.

The midwifery situation from our study of these three counties reveals a very serious situation, but from our experience we have every

reason to believe that it will be possible with proper supervision and regulation to bring the practice to such standards as to protect maternal and infant life, as can readily be seen from the detailed report attached.

In the Division of Boarding Homes, dealing with infants and children, and problems associated with dependent mothers, we are studying each county to learn of the existence of institutions, like day nurseries, infant asylums, baby's hospitals, children's dispensaries, to examine into their sanitary and hygienic standards and to solicit their co-operation in making them a more active part of the child hygiene work of the county.

The study is also directed to the family welfare and social agencies so that the nurses of the State Department, or co-operative organizations, may be advised to whom to refer social and economic problems that affect the welfare of the mothers and children.

Where our study reveals that there is need for the establishment of an organization of this character, we hope through conference and co-operation to assist in the creation of these agencies.

Part of this work has been done in Mercer, Middlesex and Hudson counties, and considerable improvement has been effected in day nurseries, in the enforcement of regulations and the supervision of boarding homes by municipalities, in the establishment of prenatal clinics, and the closer co-operation for the care of the unmarried mother.

The Division of Education and Extension has undertaken to familiarize the school officials and health authorities and interested citizens of the counties with the child hygiene program, which has for its purpose the proper health supervision of the child from the prenatal period to adolescence, and the introduction of continuous supervision of all children in a family by a single nurse for the purpose of greater efficiency and economy.

Meetings have been arranged with the County Medical Societies, and in many instances private conferences have been held with Boards of Education and Boards of Health for the purpose of obtaining that degree of co-operation and co-ordination necessary for the proper carrying out of this continuous child hygiene program. The most complete demonstration will probably be made in Burlington county, where we believe through the appointment of a motor corps and the active co-operation of the school authorities, it will be possible to make available for the child and its mother in the most out-of-the-way places all the resources of hospitals, clinics and child and school hygiene.

On July 1st the legislature made available to this Division \$125,000, the largest appropriation, I believe, that any state has appropriated for the protection of mothers and infants. Arrangements are completed for the establishment of child hygiene work in every county in the state, and we believe that through the active co-operation we are obtaining from the various Bureaus of our own Department

DIVISION OF CHILD HYGIENE.

135

and the Council of Defense and all organizations throughout the state interested in the welfare of mothers and infants that New Jersey will successfully fight on to make it a place that is safe for its mothers and infants.

DIVISION OF MIDWIFERY.

MISS FLORENCE SWIFT WRIGHT, SUPERVISOR.

The supervision of midwives was begun January 1st, 1919, with one supervisor. A preliminary survey of Mercer, Essex, Hudson and Middlesex counties has been made and similar work has been begun in Bergen, Burlington and Camden counties. The results of the surveys, so far as finished, are indicated in the accompanying tables.

The first step in making a county survey has been to call on all midwives who reported births during the three preceding months. A call has also been made on at least one physician living in neighborhoods where midwives practice. The active, licensed midwives have given information as to others attending fewer cases and have pointed the way to obtaining evidence of illegal practice by unlicensed midwives. Physicians visited have confirmed many of the findings and suspicions of the investigator.

Patients of licensed midwives have been visited in a friendly way, interest in the child being the usual approach, in order to make an estimate of the ability and willingness of the midwife to cope successfully with the adverse conditions under which she must often work. The points studied are the actual care given to mother and child and instructions left by the midwife, with the family for feeding and care of both.

Further information as to the details of the midwives' practice have been gained from the admissions of the midwives themselves. Statements as to the midwives's equipment are based on inspection of the outfits in use.

The survey of the midwife situation of the whole state will be accomplished in the near future.

Active Supervision Established in Burlington and Mercer Counties.

Based on the information obtained, active supervision of midwives has been established in Mercer and Burlington counties. A course of lessons and demonstrations on simple, essential features of midwifery such as the proper disinfecting of the midwife's hands, aseptic care of the child's navel, has been planned, which should bring the work of many midwives up to date and improve the practice of all midwives.

A meeting place has been provided, through the hospitality of the International Institute of the Young Women's Christian Association. A meeting of midwives was held on May 28th, which was attended by 75 per cent of the active midwives. After refreshments and a

pleasant social hour, demonstrations were given and an informal organization (The Midwives' Association of Mercer and Burlington Counties) was formed, for the purposes of improving the practice of midwifery and of promoting the health of mothers and babies. Meetings are to be held monthly, and later well known obstetricians and baby specialists will be invited to speak to the midwives.

Supervision Essential, Even After Good Training.

The relation of the training of the midwife to the quality of her work seems less important than might be supposed. We have accurate knowledge of the methods of two schools of midwifery, both of which teach excellent obstetrical technique. Twenty-two of the midwives so far traced, have had training in one or both of these schools. With perhaps two exceptions, these midwives lack essential articles of equipment, and fail, according to their own admissions, to observe important precautions, which they were taught in training.

The results of supervision are well illustrated by the experience of Newark, where midwives have been supervised since 1913 and where the standards of practice are noticeably superior to any observed elsewhere in New Jersey. Essex county midwives, who conform to the regulations when practicing in Newark, maintain a much lower standard of work in their practice in other parts of the county.

General improvement in midwifery practice in New Jersey will be possible only by dealing firmly and consistently throughout the state, with four general classes of midwives.

(a) The ignorant, untrained woman of dirty habits, who cannot be taught, must be forced to abandon midwifery as a means of livelihood.

(b) The trained, skilled, shrewd woman, who ignores or defies the law, must be forced to abandon the practice of medicine, surgery or worse, which our survey in four counties has shown to be very common. It must be made possible to revoke her license for these acts. A supplement to the State Sanitary Code regulating the practice of midwifery is now in preparation and will give the necessary power to proceed without undue delay against this type of midwife.

(c) The poorly trained, honest, intelligent woman must be taught better methods and she must be closely supervised, in order to keep her work up to a safe standard.

(d) The well trained midwife must be helped, or forced to keep her work to the standard she knows, in spite of all difficulties encountered in tenement homes.

All midwives must be taught the advantages of prenatal medical supervision and to observe the law restricting their work to normal cases.

Most midwives, probably all who want to do good, honest work, welcome instruction and supervision and appreciate the interest of the State Department of Health, which invites them to be co-workers for the protection of mothers and infants.

Actual equipment taken from midwife. Unfortunately it was impossible to photograph the dirt and the odor. Note the old, dirty, torn bag with "sterile" cotton and tape within it.

- | | |
|---|--|
| 1. Paregoric. | 6. Quinine pills. |
| 3. Rusty catheter. | 7. Unlabelled bottle, said by the midwife to contain a disinfectant. |
| 3. Dirty douche nozzle. | 8. A jar of dirty vaseline, showing finger marks. |
| 4. Filthy soft silk catheter, reinforced with wire. | |
| 5. Laudanum. | |

This equipment also contained a rubber fountain syringe, which was in such a bad condition that one was reluctant to carry it.

Equipment recommended by the State Board of Health—A clean, sanitary equipment for a midwife. Note the smooth leather bag in good repair—dusted and sunned weekly—the removable washable white lining which protects the open bag and the contents of the closed bag.

1. Allover apron and cap.
2. Five freshly ironed towels.
3. Boric acid powder.
4. Silver nitrate.
5. Ergot.
6. Vaseline in tube.
7. Nail cleaner.
8. Tincture of green soap.
9. Lysol.
10. Hand brush.
11. Squares of sterile gauze and sterile tape.
12. Sterile cotton in small packages.
13. Thermometer.

A few of the many forbidden drugs found in midwives' equipment.

1. Lethicin.
2. Box of Methylarsol ampoules.
3. Ampoules from No. 2.
4. Laudanum.
5. Iron arsenate ampole.
6. Unlabelled bottle said by the midwife to contain paregoric.
7. Assorted, unlabelled pills. The large white ones said by the midwife to be cathartic pills; the small pink ones said by the midwife to be used for fever; the small white ones said by the midwife to be used when the woman felt weak.
8. Headache wafers containing acetanilid.
9. Tablets of morphine, grain one-fourth.
10. Box of iron arsenate ampoules.
11. Box of pituitrin ampoules.

A few forbidden articles found in midwives' bags.

1. Sponge enclosed in a silk net with a string attached.
2. Cervical dilators.
3. Wires from soft silk catheters.
4. Soft silk catheter (dirty), with wire inserted.
5. Cervical pessaries.

Division of Education and Extension.

EMILY S. HAMBLÉN, SUPERVISOR.

The Supervisor of Education and Extension took office December 1st, 1918. The first duty was to seek contact with the State Organization of the National League for Women's Service and the Warren County unit of the Child Welfare Committee of the Council of National Defense. The results were the opening of Stations in Phillipsburg and Passaic. About this time the National Red Cross Society put forth its public health program and conferences were arranged with the leaders of the Atlantic Division with a view to so co-ordinating the work of the Red Cross and the Bureau of Child Hygiene that the public health programs of the two organizations should be constructive and supplemental one with the other. In a later conference with the Director of the Bureau of Child Hygiene, the Red Cross leaders in New Jersey agreed to co-ordinate their work with state work by supplying district nurses for bedside and obstetrical cases and to assist in such relief cases as were brought to their attention by the state nurses. Headquarters of the Atlantic Division have also agreed not to accept overtures from any municipality of New Jersey without first having notified the Bureau of Child Hygiene. At the same time relations were established with the Motor Corps of America in consequence of which automobile service may be made available which may be of fundamental importance in working out the plan of rural service. In fact, the plan is under way in Warren and Burlington counties.

Consideration of the child hygiene work with the Extension work of the State College of Agriculture is planned along lines of instruction of mothers and girls in the subject of dietetics and in the extension of all educational health work to rural communities. County Agents and teachers in the vocational schools are co-operating with the workers of this Bureau.

This correlation, taken in connection with the plan of the Director to form a State Child Welfare Council composed of representative members of various organizations, working in co-operation with the Child Welfare Committee of the Council of Defense—the Council to be an auxiliary to the State Departments—bids fair to reduce to a minimum the dangers of a confused and chaotic condition due to lack of mobilization of the social forces.

For the extension work on a county basis data were collected which showed to a considerable extent activities along child welfare lines and the equipment of the state in institutions and personnel. This has been followed up by correspondence with the workers and the officials of each county and by personal visits to all municipalities which seemed to offer places as key positions with reference to the county situation. Great assistance in planning county work has

been given by the County Superintendents of Schools, and hearty offers of co-operation have been secured from school principals, health officers and other public officials. Civic societies and Child Welfare Committees have also been most helpful, in some cases very active. Everywhere has been found appreciation of the need for the work of child conservation and recognition of the fact that effort to be effective must be centralized and unified. A number of county meetings have been held where all the child welfare agencies have been represented.

The work has progressed to the point where the Bureau has ready for July 1st a base of operation in each county and a plan for expansion of the work from this base. Of the twenty-one counties, Essex, Bergen, Union, Monmouth, Ocean, Cape May, Somerset and Hunterdon will have one nurse each early in July. Hudson, Passaic, Warren, Sussex Morris, Mercer, Atlantic, Salem and Gloucester will have two nurses. Camden and Cumberland will have three, Middlesex four and Burlington five or possibly six nurses.

Along educational lines letters have been sent health officers and papers of the state explaining the work of the Child Hygiene Bureau; press articles have been written for most of the local papers in places where stations have been opened. A poster exchange has been arranged with the Stations, reports for the Public Health News, Legislative Index and League of Municipalities and the daily papers have been written and much literature, graphic and descriptive, has been selected and distributed through the Child Welfare Committee in connection with the celebration of Baby Week.

The special feature of Baby Week was a drive for better birth registration. Returns which have come in indicate that in some few municipalities the work was very thoroughly done, while in others it is being postponed until the fall. It is hoped, however, that the result will be to place New Jersey in the Birth Registration Area of the United States.

Division of Boarding Homes, Children's Institutions and Dependent Mothers.

HENRIETTA HENIUS, SUPERVISOR.

Boarding Homes—It has been found in the counties thus far surveyed, namely, Hudson, Middlesex and Mercer counties, that only one city has an ordinance requiring the licensing of boarding homes for children. This practice is maintained in the City of Trenton, and the investigation of the homes has just begun.

An effort is being made to fix the responsibility for the proper supervision of boarding homes for children, upon some one organization in each community. In this respect it might be well to lay stress upon the advantage of having a state ordinance which would require all persons, who sought to board children, to secure a license toward that end, from the State Department of Health.

Day Nurseries—The day nurseries in Hudson, Middlesex and Mercer counties have been visited and while most of them are properly conducted, a number of conditions were found that if continued would mitigate against the welfare of the children. On the whole it was found that these nurseries welcomed suggestions, and will endeavor to avail themselves of the co-operation of this Division. A clause should be included in the ordinance for Boarding Homes that will require licensing and supervision from local or State Department of Health.

Unmarried Mother Problem—In the three counties above referred to, an agency has been designated in each of the larger communities which will supervise the unmarried mothers in order that the infants of these mothers may be born under proper conditions, and that they may not be separated from their mothers after birth. The agencies through whom this plan will be put into operation will endeavor to notify this Division of all such cases handled by them, and will cooperate with us in bringing about the best results for the infant of the unmarried mother. It is hoped that as this work becomes more generally known the percentage of infants separated from their mothers will be materially reduced.

Mothers in Industry—This Division is also endeavoring to discourage the employment of mothers with infants under one year. This calls for the co-operation of Employers, Overseers of the Poor of the various communities and also of Charity Organization Societies or similar organizations. It is hoped that the time will come when we can state that no factory in New Jersey employs mothers with infants under one year of age.

Report of the Bureau of Venereal Disease Control.

J. HOLMES SMITH, JR., P. A. SURGEON, U. S. P. H. S., CHIEF.

Report of the activities of the Bureau of Venereal Disease Control, between the period, August 15th, 1918, to June 30th, 1919, inclusive.

The activities of the Bureau of Venereal Disease Control have been varied and depend largely upon the needs of the moment. The work of the Bureau might be summarized under several headings:

First, Clinical; second, Detention Facilities; third, Repressive Measures; fourth, Educational.

Clinical—During this period the following clinics (either already in existence or established at our request) have been co-operating with this Department: Camden, Trenton, Elizabeth, Plainfield, Newark, Jersey City and Orange. It is expected in the near future to have clinics in New Brunswick, Perth Amboy, Long Branch, Glen Ridge and Atlantic City. Clinics not co-operating with this Department are now in operation in Asbury Park, Bayonne and Paterson.

Detention Facilities—In the larger cities such as Newark and Jersey City, provision is made for admitting to the Municipal Hospital, cases of venereal diseases requiring hospital treatment. In the City of Trenton, a separate venereal disease hospital is now under construction in the Municipal Colony, and in the course of several months will probably be placed in operation. The City of Paterson maintains a separate farm where prostitutes suffering from venereal diseases can be isolated and held for treatment. In the majority of instances, women arrested in the neighborhood of a military camp were detained in the county jail during the period of their infectivities. In several localities such patients were transported several times a week to one of the nearby clinics for treatment.

Repressive Measures—Nothing has been attempted by this Department in the line of repressive measures. The state law being entirely inadequate for such procedure and the last legislature failing to act upon such measures, no steps have been taken along these lines.

Educational—This has consisted of the following: Exhibition of motion pictures and lantern slides; distribution of literature; lectures; newspaper articles and billboard advertising. The motion pictures exhibited have been "Fit to Fight," and the "End of the Road," and animated pathological pictures and scenes taken from the Trenton Venereal Disease clinic. The pictures "Fit to Fight" and "The End of the Road" were not the private possession of this Bureau, and consequently were shown only during the limited period of time.

A great deal of interest was shown in them, and it is believed a considerable amount of good was accomplished. The lantern slides consisted of an exhibit entitled "Keeping Fit" and also a set of pathological slides. The literature distributed has consisted mainly of a series of pamphlets which were published under the auspices of the United States Public Health Service. To date approximately 364,700 pamphlets have been distributed, some of which have been sent to every state in the Union, to Canada, Hawaii, Canal Zone and Cuba. The lectures have been of various characters, some before medical societies, some to miscellaneous gatherings, and many in industrial establishments. The total about 154. Newspaper articles have been published from time to time. On several occasions full page or half page ads were placed in a number of the leading newspapers. This form of advertising has been found to be very advantageous, but very expensive. About the 1st of May, it became possible to secure in the City of Trenton several of the large billboards formerly used for advertising the "Liberty Loans." The only cost to the Department being that of painting. Four of these were displayed in the City of Trenton and three along the line of the Pennsylvania Railroad. The results have been so favorable that it has been decided to employ this method in other parts of the state. At the same time advertising placards have been placed in street cars and special lantern slides devised for showing during the regular performances in the motion picture houses.

Before closing it might not be amiss to state that our present plans of campaign consist largely in circularizing our activities in certain cities during a given period of time. During this time our representatives devote the most of their activities to these locations, and it has been found that this brings excellent results. First: As regards the enthusiasm on the part of citizens; second, in enactment of local ordinances, increasing the attendance at the clinic and securing of local funds for carrying on the work in the locality.

Report of the Bureau of Vital Statistics.

DAVID S. SOUTH, CHIEF.

A change in the date of publishing the annual reports of the various departments prevented a publication of the report of the Bureau of Vital Statistics for the year 1917, and therefore the tables in reference to births, marriages and deaths contained in the following pages shows this data for the calendar year 1917 and the calendar year 1918.

For proper statistical study it is necessary to continue the publication of certain mortality data year by year. However, on recommendation of the Commissioner of Reports, the tables which follow have been abbreviated as much as possible.

Since the publication of the last report of the Bureau the legislature has enacted a law requiring the Department to furnish, free of charge, certified copies of birth records to be used in cases where the applicant desires to procure employment.

In a communication to the State Department of Health it has been recommended that the old records—that is, those records dating from 1847 to 1878—be completely indexed. While this would mean considerable work, the records are in such a state that the constant handling of the same will ruin them for all practical purposes. It is therefore urged that an appropriation of about \$2,500 to \$3,000 per year be made for the purpose of starting and continuing such indexes until they are completed. Such an appropriation would permit the employment of three clerks at a salary of \$60 per month, the remainder of the appropriation being used for stationery and other incidentals. This appropriation would be made year after year until this work is completed.

To make for still greater efficiency in the Bureau of Vital Statistics, it is earnestly recommended that the Department prepare and present to the Legislature a revision of the laws in reference to the filing of births and deaths, the proposed act to be patterned after what is known as the Model Law requiring the registration of vital statistics, which act is now in force in several of the registration states. In the State of Pennsylvania excellent results are being secured under this law, and with the various local registrars throughout the state under control of the State Department of Health, there is no doubt that our efficiency as a registration state would be greatly increased. We would be in a position to procure the registration of practically all births that take place in the State of New Jersey, and under such a law when certificates were filed in the Bureau of Vital Statistics they would necessarily be complete and accurate, thus forming a basis for the study of infant mortality, and other problems so necessary for the conduct and promotion of the public health.

DEPARTMENT OF HEALTH.

The following table is a summary of the various records filed in the Bureau of Vital Statistics for the calendar years 1917 and 1918, together with the number of searches and certified copies prepared in the Bureau and the amount of fees received therefor:

GENERAL SUMMARY.		
	1917	1918
Deaths registered, indexed and tabulated.....	43,532	60,852
Births registered, indexed and tabulated.....	75,278	74,549
Still-births registered, indexed and tabulated.....	3,183	3,525
Marriages registered, indexed and tabulated.....	30,060	23,989
<hr/>		
Total records registered, tabulated and permanently preserved	152,053	162,915
<hr/>		
Certified copies issued and searches made for which fees were received	4,408	7,245
Certified copies issued and searches made in pension cases for which no fees were received.....	4,383	4,947
Fees returned to State Treasurer for certified copies and searches	\$3,423.30	\$4,979.15

MARRIAGES DURING THE WAR.

During the year 1918, 23,989 marriages were reported to the Bureau of Vital Statistics, which was a decrease of 6,071 from the previous year. This decrease appears to be evenly distributed among the various counties of the state, with the exception of those places in which cantonments or other government stations were located.

In Bergen county where Camp Merritt is located the marriages for 1917 was 1,378, and for 1918, 1,327. However, in Burlington county, in which Camp Dix is located, the marriages in 1917 were 557, and in 1918, 876.

The greatest decrease of any district in the state is shown in the marriages from Hudson county where, during the year 1917, 7,366 marriages were reported, and in 1918, 5,527, a decrease of 1,839. Large decreases were also shown in the marriages from Passaic county, Middlesex county, Mercer county, Camden county and Union county.

BIRTHS.

In order to properly promote the child welfare work a more complete study and analysis of birth records must be made and certain tabulations permitting an intelligent study of the infant mortality rate in various localities should be prepared and published.

In most of the leading registration states the publication and preservation of this data is considered invaluable, and it is therefore recom-

BUREAU OF VITAL STATISTICS.

151

mended that the Department ascertain from the Commissioner of Reports or the Board that has these publications in charge, whether a series of these tables may be published if prepared in order that our work in this line may compare favorably with other states leading in this line of work.

It is recommended that beginning with the calendar year 1920 all births be credited to the district in which the parents reside, regardless of where the birth takes place. In many municipalities throughout the state a large percentage of the births are of non-residents in adjoining districts, and the same statistical treatment of births should prevail regarding resident and non-resident births as is now practiced with the resident and non-resident deaths.

Tables should be prepared showing the number of illegitimate births by districts, as well as births by nationality of parents. The births among the white and colored inhabitants by districts should also be published from year to year.

DEATHS.

The total number of deaths for 1917 was 43,532, and for 1918 the deaths were 60,852, an increase of 17,320. However, a study of the deaths from various diseases year by year will show that the total death-rate from most ailments is lower in 1918 than in 1917. The exception was in deaths from influenza which raged in epidemic form in practically every district of the state from September to December, 1918, when thousands of our citizens of all ages and in all walks of life were stricken.

List of Licensed Health Officers and Sanitary Inspectors

Following is a list of the persons who have successfully passed the examination provided for in the act approved April 18th, 1903:

HEALTH OFFICERS.

Henry D. Abbott, M. D.	Bayonne.	John Gaub	Montclair.
John K. Adams, M. D.	Orange.	A. I. Goehrig	Trenton.
T. Lee Adams	Ocean City.	Eugene H. Goldberg, M. D.	Kearny.
Jos. Adler, M. D.	Bayonne.	Hyman L. Goldstein, M. D.	Camden.
Martin E. Alpers	Dover.	Wm. S. Green, M. D.	Paterson.
Henry V. Amerman	Kearny.	Chas. A. Griffin, D. V. M.	Orange.
Fritz M. Arnolt	Hackensack.	I. N. Griscom, M. D.	Ocean City.
T. Dudley Ballinger	Princeton.	Edward Gulon, M. D.	Atlantic City.
Wm. M. Barns, M. D.	Millburn.	Selskar M. Gunn	Orange.
Howard L. Baumgartner	Asbury Park.	James J. Hagan	Jersey City.
J. Alonzo Beek, M. D.	Gloucester City.	Orville R. Hagen	Paterson.
John K. Bennett, M. D.	Gloucester City.	John J. Haley, M. D.	Gloucester City.
Joseph V. Bergen, M. D.	Paterson.	John Hall	Long Branch.
Richard Bew, M. D.	Atlantic City.	Lester Haublet	Asbury Park.
Duncan W. Blake, Jr., M.D., Gloucester City.		Carl Hegstrom	Perth Amboy.
Chas. B. Bleasby, M. D.	Garfield.	Alex. M. Heron, M. D.	Lakewood.
Perkins Boynton	Little Falls.	Richard B. Hiller	Plainfield.
Henry H. Brinkerhoff, M. D.	Jersey City.	F. M. Hoffman, M. D.	New Brunswick.
Chas. S. Brady, M. D.	Town of Union.	Wm. L. Holt, M. D.	Maplewood.
John J. Broderick, M. D.	Jersey City.	J. I. Hoverder, M. D.	Ateo.
Wm. H. Brooke, M. D.	Bayonne.	Robert N. Hoyt	Summit.
James E. Brooks	Glen Ridge.	Edward R. Hunter, M. D.	Delanco.
J. Alex Browne, M. D.	Paterson.	Morton W. Huttenloch	Montclair.
David E. Buckley	West Orange.	Ralph L. Huttenloch	Montclair.
Dundas R. Campbell, M. D.	Newark.	H. W. Ingling, M. D.	Freehold.
Collis H. Case	Plainfield.	Wm. H. Iszard, M. D.	Camden.
John J. Casey	Plainfield.	Maximilian Jakoby, M. D.	Chrome.
N. J. Randolph Chandler	Plainfield.	Henry C. James, M. D.	Mays Landing.
T. A. Clay, M. D.	Paterson.	Ralph R. Jones, M. D.	Toms River.
Ralph O. Clock, M. D.	Burlington.	Chas. A. Keating, M. D.	Paterson.
Morris W. Clouse, M. D.	Kearny.	Jay E. Kilpatrick	Montclair.
Nathan A. Cohen, M. D.	Wildwood.	Chester H. King, M. D.	Oradell.
Max J. Colton	New Brunswick.	I. Warner Knight, M. D.	Penn's Grove.
John T. Connelly, M. D.	Bayonne.	W. U. Kurtz, M. D.	Asbury Park.
Wm. C. Craig, M. D.	Ridgewood.	Chas. J. Larkey, M. D.	Bayonne.
Chas. V. Craster, M. D.	Rosebank, N. Y.	Geo. W. Lawrence, M. D.	Lakewood.
Jos. J. Craven, M. D.	Jersey City.	Malcolm Lewis	Montclair.
E. Irving Cronk, M. D.	New Brunswick.	J. William Long	Trenton.
Grant P. Curtis, M. D.	Town of Union.	J. C. Loper, M. D.	Bridgeton.
Samuel S. DeCou	Trenton.	John L. Lund, M. D.	Perth Amboy.
Jeremiah J. Donovan, M. D.	Rosindale, Mass.	Henry MacDonald	Newark.
W. D. Dotterer	Princeton.	Wm. H. MacDonald	Trenton.
Thos. J. Duffield	Asbury Park.	J. Scott MacNutt	Orange.
Wallace T. Eakins	New Brunswick.	L. F. Maloney, M. D.	Clifton.
Chas. P. Eaton	Jersey City.	Alex. Marcy, M. D.	Riverton.
Frank H. Edsall, M. D.	Jersey City.	V. M. D. Marcy, M. D.	Cape May.
Nelson Elliott, M. D.	Passaic.	T. W. Margerum	Princeton.
R. Clifford Erickson	Long Branch.	Elias J. Marsh, M. D.	Paterson.
Edward P. Essertier, M. D.	Hackensack.	Emery Marvel, M. D.	Atlantic City.
James A. Exton, M. D.	Arlington.	Harriet O. Mattison	Plainfield.
Wm. T. Fales	Glen Ridge.	Samuel D. Mayhew, M. D.	Bridgeton.
Morris Farkas, M. D.	West Orange.	John T. McClure	Harrison.
A. S. Fell, M. D.	Trenton.	Charles McNabb	Bound Brook.
Geo. W. Finke, M. D.	Hackensack.	John J. McDonald	Jersey City.
Geo. V. Fithian, M. D.	Perth Amboy.	Frank B. Meeker, M. D.	Newark.
