NEW JERSEY
REVISED TOTAL AND INTERIM AGE & SEX*
POPULATION PROJECTIONS

JULY 1
1980 - 2000

STATE OF NEW JERSEY
BRENDAN T. BYRNE, GOVERNOR

Department of Labor and Industry
John J. Horn, Commissioner

**NOTE: There are two parts to this report. Part I differs from Part II in that Part I presents revised total population projections, which supersede projections previously published. Part II shows the results of this Department's first attempt to use a demographic-economic model to produce interim age and sex projections. The total projected populations in Part II are consistent with the numbers from the ODEA model presented in Part I.*

April, 1979

AN EXPLANATION OF METHODS

INTRODUCTION

The numbers in Part I of this report represent revised population projections to the year 2000 for the State of New Jersey and its twenty-one counties. These projections supersede all other projections issued in the past by the Department of Labor and Industry. Part II shows the results of this Department's first attempt to use a demographic/economic model to produce age and sex projections. The total projected populations in Part II are consistent with the numbers from the ODEA model presented in Part I.

Revised projections in Part I differ for several reasons from the interim projections published in 1978 by this Department. In general, this Department's own internal review was supplemented during the past year by review and comments from interested and knowledgeable individuals in the public and private sectors. All of the projections series have been benchmarked to the most recent set of current population estimates produced by this Department and reflect revised and/or updated input data. In the 1980 projections only, the impact of the 18-month moratorium on construction in the Pinelands was taken into consideration. Because of the uncertainty at the present time regarding the nature and type of development or lack of development in the Pinelands after the moratorium and because these projections are baseline or nonpolicy oriented, no constraints on development were assumed in the Pinelands after 1980.

Because of the demand for age and sex projections this Department endeavored to produce such projections using a demographic/economic model (ODEA). The results represent a "first-cut" set of projections for the State and its counties and are primarily for review purposes. It is hoped that, as with the interim total projections produced in 1978, these projections by age and sex will be reviewed and commented on by all interested users to help in the Department's own evaluation of these numbers.

Present plans call for the continual revision and modification of both the total, and age and sex projections, incorporating the most current data and techniques as they become available, as well as suggestions offered by all interested agencies and individuals.

Baseline Projections - Not Forecasts and Not Goals

The numbers are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the rules and assumptions of the method proved to be empirically valid in the

future. Projections may assume continuations of past conditions, present conditions, or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgmental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts.¹ Again, numbers in this report are projections.

Furthermore, the projections in this report are not to be interpreted as goal or policy oriented. They are not intended to constrain or to advocate specific levels of growth in any area of the State. All series are presented as baseline, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen or undocumented nature or magnitude. They are based primarily on identifiable demographic and economic secular trends which have been implicitly or explicitly incorporated into the models, and secondarily on a few explicitly defined, documented structural changes, whose impacts are currently being felt in the State. The greatest value of these projections, especially the ODEA series, is as a reference framework for planning, policy evaluation, and considerations of alternative growth scenarios which could be achieved through greater or less resource development.

Four Approaches to Future Population Levels

There exists a large number of projection techniques and models for projecting the future levels of population, as well as changes in their internal composition.² These range from the naive - the simple extrapolation of past trends - to the more complex which strive to model the causal determinants of population change. On the one hand, naive approaches usually project the future without trying to understand any of the dynamic factors behind population change. On the other hand, over-complexity of the more rigorous techniques can create challenges to operationalization. Efforts to model interacting forces may be constrained by data limitations, which, in turn, can restrict the derivation of empirical linkages and inhibit the calibration of theoretically specified relationships.

¹ Donald B. Pittenger, Projecting State and Local Populations (Cambridge, Mass.: Ballinger Publishing Company, 1976), pp. 3-4.

² For example, see: U.S. Bureau of the Census, The Methods and Materials of Demography by Henry S. Shryock, Jacob S. Siegel and Associates (Washington, D.C.: U.S. Government Printing Office, 1976); Donald B. Pittenger, ibid; and, Richard Irwin, Guide for Local Area Projections, U.S. Bureau of the Census Technical Paper No. 39 (Washington, D.C.: U.S. Government Printing Office, 1977).

These practical problems with projection models are essentially a function of the current state of the art. Nevertheless, there is a very present need for population projections, and an effort must be made to directly incorporate at least some factors which have been assumed to affect population change.

Four approaches for modeling projected populations of New Jersey and its twenty-one counties, which range from the naive to somewhat complex, were chosen by the Department of Labor and Industry. Three are almost totally demographic - one is a simple, long-run linear-regression method (REG); two are based on recent, short-run crude-rate component methods (C65 and C70). The fourth approach is a demographic-economic linked model (ODEA). The ODEA model is a theoretical improvement on the naive techniques, and it is for this reason that the results of the ODEA model are recommended to the user. The results of the other techniques are primarily presented for comparison.

BASIC ASSUMPTIONS

All of the methods reflect several common denominators. At the most general level, it is assumed that no catastrophe, natural or man-made, will occur in the projection period; war, famine or other disaster will invalidate the results. In addition, a continuation of past and present economic and demographic trends have been assumed. The ODEA model in particular is based on a healthy national and State economy in the projection period. Because this Department has an ongoing program of preparing population estimates, the projections incorporate the most recently revised 1975, 1976, and 1977 estimates for New Jersey and its counties. Also, all four sets of projections take into account demographic and economic impacts of casino gambling in Atlantic County and on nearby counties. And, information from a survey of county planning boards has been used as additional input to the projections, particularly in the ODEA model. The impact of the 18-month moratorium on construction in the Pinelands is considered in the appropriate counties for 1980 only. Because of the uncertainty at the present time regarding the nature and type of development or lack of development in the Pinelands after the moratorium and because these projections are baseline or nonpolicy oriented, no constraints on development were assumed in the Pinelands after 1980. Once again, because these are baseline projections only that portion of Meadowlands development which has been committed or is in various stages of the pipeline development process has been included in the projections for the affected counties. As other projects or programs associated with the Meadowlands become more clearly defined or substantial resource commitments made, future impacts will be shown in later revisions to these baseline projections.

A very brief overview of the four methods follows.

4

DEMOGRAPHIC-ECONOMIC LINKED PROJECTION MODEL (ODEA) - (Preferred Set of Projections)

This population projection model is conventionally labeled the cohort-component method, and is premised on the recognition that population change is a function of natural increase and migration. Simply put, a population is survived into the future, net migration is determined, and births are projected by applying fertility rates to female populations.

In this effort, three groups of populations were projected separately: the civilian population under 65 years of age; the civilian population 65 years of age and over; and the military. The difference between the projection of the under 65 years of age civilian population and of the 65 years of age and over civilian population lies in the migration component. Migration of the population under 65 years of age is projected primarily on the basis of economic factors. Employment, unemployment rates, labor force participation rates, and various other factors, such as commutation and residential preference, all play a part. It is this linking of migration to economic variables that gives the model its name. Migration of the 65 and over population is based on trends from recent rates. The future levels of the military is a function of federal policy; therefore, the present level of military population was held constant to the year 2000.

The Survived Population

The civilian populations³ were survived by employing age-sex-race-specific survival rates. The survival rates used for the projections are the most recent national rates.⁴ These reflect a significant decline in mortality from major cardiovascular diseases among older adults. A continuation or acceleration of this decline or a major medical breakthrough, such as a cure for cancer, which has not been assumed, could have a marked effect on these rates and consequently on the results of the model.

Migration

The projection of net migration for the civilian population under 65 years of age is derived primarily from projections of resident labor demand. The major assumption is that economic opportunity in a county stimulates the movement of people under the age of 65. The question of a direct causal

³The base population for the initial sequence of the model represents the corrected 1970 Census data by age, race, and sex, and experimental estimates of the July 1, 1970 and 1975 population by age, race, and sex developed by the U.S. Census Bureau.

⁴See: U.S. Bureau of the Census, Current Population Reports, Series P-25, No. 704, "Projections of the Population of the United States: 1977 to 2050," U.S. Government Printing Office, Washington, D.C., 1977.

relationship between economic opportunity and migration is left unanswered. However, previous empirical studies have indicated that the two phenomena are correlated and that there is an interaction between migration and the demand for labor.⁵ The procedure in the ODEA model was to project net migration of New Jersey counties on the basis of projections of resident labor demand and labor force supply, which incorporated such factors as employment activity, unemployment rates, labor force participation rates, and other factors, such as commutation and residential preference.

Operationally, resident labor force demand for each projection period was compared to the survived labor force supply. The residual of these two independent projections was assumed to represent labor force migration, i.e., the supply and demand sectors interact to generate population movements, which in turn was pyramided to total civilian population migration under 65 years of age.⁶

The migration of the elderly population (65 years of age and over) was calculated by a separate submodel. The basic approach was to survive the elderly population by race and sex, and find the difference between the survived population and the estimated 1975 population.⁷ Five year sex-race-specific net migration rates were then derived for the period 1970 to 1975. These rates were reduced each five-year period.

Under 5 Years of Age Population

To determine the under five years of age cohorts, general fertility rates were applied separately to the survived (closed) and net migrant cohorts of women of childbearing age (15 to 44 years of age). The county-specific general fertility rates were calculated and projected in line with the national Series II projections based on the historical relationship of the county rates to national rates.⁸

⁵Ira S. Lowry, Migration and Metropolitan Growth; Two Analytical Models (San Francisco, Calif.: Chandler, 1966), pp. 40-44.

⁶Similar approaches are reported in: Maryland Department of State Planning, Division of Research Programs, Maryland Projections Series, Population and Employment 1975-1990 (Baltimore, MD: 1975); Pennsylvania Governor's Office of State Planning and Development, Pennsylvania Projection Series: Population and Labor Force, Report No. 73 (Harrisburg, Pa.: Commonwealth of Pennsylvania 1975); Joe W. Lee and William B.D. Hong, "Regional Demographic Projections: 1960-1985" 1972 Regional Economic Projection Series, Report No. 72-R-1 Washington, D.C.: National Planning Association, 1972).

⁷Medicare enrollment data was used to estimate the 1970 and 1975 elderly population, along with data from the 1970 Census of Population.

⁸The county general fertility rates were derived from data obtained from the New Jersey Department of Health. The projected national general fertility rates were secured from: U.S. Bureau of the Census, Current Population Reports, Series P-25, No. 704, "Projections of the Population of the United States: 1970 to 2050," Series II, U.S. Government Printing Office, Washington, D.C. 1977.

Series II assumes the ultimate level of completed cohort fertility will be 2.1 births per woman. This figure is reasonable but significant deviation from it in either direction is possible in the projection period. Additionally, shifts in the timing of births (for example, an acceleration in the trend toward postponing the birth of the first child until the late twenties) will affect these rates and with them the validity of the projections.

Total Open Population

The total open population for each year is the sum of the survived population, net migrants under 65 years of age, net migrants 65 years of age and over, births during the five-year period, and the present levels of military strength for some counties. Additionally, growth induced by casino gambling is incorporated into Atlantic County's and other nearby counties' populations, and the impact of the 18-month moratorium on construction in the Pinelands for 1980 only is reflected in the appropriate counties.

1970 TO 1977 CRUDE COMPONENT PROJECTIONS (C70)

The purpose of this series is to demonstrate the effect of maintaining the birth and death patterns of the middle 1970's and migration of the first seven years of the 1970's throughout the rest of the century. In addition, the series includes population increases in Atlantic and nearby counties due to the projected economic impact of casino gambling in Atlantic City. The impact of the 18-month moratorium on construction in the Pinelands for 1980 only is considered in the appropriate counties.

The series projects the three components of population change independently for each of the counties and the State. Births, deaths and net migration are computed for each projection interval. These figures together with the population at the start of each interval yield the population at the end. The process starts with the 1977 estimates of population for the counties and the State. Births and deaths in the three-year interval from 1977 to 1980 are computed based on the 1976 crude birth and death rates applied to the 1977 estimates. Net migration is similarly computed using rates based on net migration for the years 1970 to 1977 as reported in the U.S. Census Bureau's Current Population Reports, Series P-25, No. 77-30. These figures together with the 1977 estimates yield the 1980 projected populations of the counties and the State. The process is repeated for all the subsequent five-year intervals to the year 2000. The figures for each component as well as the projected populations are controlled so that the counties sum to the State.

1965 TO 1970 CRUDE COMPONENT PROJECTIONS (C65)

The purpose of this series (C65) is to demonstrate the effect of coupling the birth and death patterns of the middle 1970's with a return to the migration behavior of the latter half of the 1960's, projected to the

end of the century. In addition, the series includes population increases in Atlantic and nearby counties due to the projected economic impact of casino gambling in Atlantic City. The impact of the 18-month moratorium on construction in the Pinelands for 1980 only is reflected in the appropriate counties.

This series projects the three components of population change independently for each of the counties and the State. Births, deaths and net migration are computed for each projection interval. The figures together with the population at the start of each interval yield the population at the end. The process starts with the 1977 estimates of population for the counties and the State. Births and deaths in the three-year interval from 1977 to 1980 are computed based on 1976 crude birth and death rates applied to the 1977 estimates. Net migration is similarly computed using rates based on migration for the years 1965 to 1970 as reported in the 1970 Census. These figures together with the 1977 estimates yield the 1980 projected populations of the counties and the State. The process is repeated for all the subsequent five-year intervals to the year 2000. The figures for each component as well as the projected populations are controlled so that the counties sum to the State.

SIMPLE LINEAR REGRESSION PROJECTIONS (REG)

The purpose of the series is to demonstrate how the growth trends that have prevailed since the beginning of the century would affect population change if they continued until the year 2000. The series is based on a regression of population data for each county and the State against time for the period 1900 to 1977. The results of this regression are used to make a straight line projection of population growth for each county using the 1977 estimate as a starting point. Additional population increases in Atlantic City have been incorporated into the series. Also, the impact of the 18-month moratorium on construction in the Pinelands for 1980 only is reflected in the appropriate counties. The main feature of this method is that it uses an extensive history of population changes on which to base the projections.

8

IN APPRECIATION

This Department would like to acknowledge the technical assistance of several individuals and organizations, who made invaluable contributions and recommendations to our modeling efforts. We are very grateful for the constructive criticism of our procedures and suggestions for future research provided by the following academic demographers:

- . Bryan Boulier, Office of Population Research, Princeton University
- . Eugene P. Ericksen, Institute for Survey Research, Temple University
- . Stephen Gale, Population Study Center, University of Pennsylvania
- . Michael R. Greenberg, Department of Community Affairs, Livingston College, Rutgers University
- . James W. Hughes, Department of Urban Planning, Livingston College, Rutgers University
- . Abram J. Jaffe, School of Applied Social Research, Columbia University
- . Donald A. Krueckeberg, Department of Urban Planning, Livingston College, Rutgers University
- . Philip Sagi, Population Study Center, University of Pennsylvania
- . James Trussell, Office of Population Research, Princeton University
- . Julian Wolpert, School of Architecture, Princeton University

In addition, we appreciate the comments and suggestions of attendees of the U.S. Census Bureau's Seminar on Advanced Methods of Making Population Projections (April 17-21, 1978), and special thanks are extended to the Maryland Department of State Planning, Division of Research Programs, for technical assistance provided in the development of the computer programming for the ODEA model.

Also, we appreciate the willingness of the county planning boards to cooperate in a survey we conducted with regard to potential growth in their respective counties:

Finally, we welcome suggestions and comments from reviewers of these projections. In particular, we are interested in feedback on the results from the ODEA model. Please contact the Office of Demographic and Economic Analysis, Division of Planning and Research, New Jersey Department of Labor and Industry, P.O. Box 845, Trenton, New Jersey 08625.

PART I
NEW JERSEY
REVISED TOTAL*
POPULATION PROJECTIONS

JULY 1
1980 - 2000

**NOTE: Part I differs from Part II in that Part I represents revised total population projections, which supersede projections previously published. Part II shows the results of this Department's first attempt to use a demographic-economic model to produce interim age and sex projections. The total projected populations in Part II are consistent with the numbers from the ODEA model presented in Part I.*

PART II
NEW JERSEY
*INTERIM AGE AND SEX**
POPULATION PROJECTIONS

JULY 1
1980 - 2000

**NOTE: Part I differs from Part II in that Part I represents revised total population projections, which supersede projections previously published. Part II shows the results of this Department's first attempt to use a demographic-economic model to produce interim age and sex projections. The total projected populations in Part II are consistent with the numbers from the ODEA model presented in Part I.*

INTERIM
POPULATION PROJECTIONS
BY AGE AND SEX

The age and sex breakdowns that follow were developed using the ODEA model (demographic-economic linked), which is briefly outlined under the section titled "An Explanation of Methods." This is the first time that the Department has used the ODEA model to produce population projections by age and sex, and they are primarily for review purposes.

The total State and county numbers are consistent with those presented for the ODEA model in Part I. For July 1, 1970 and 1975 the age and sex distributions were obtained from the U.S. Census Bureau's Experimental Data, published by this Department, August 1978. The numbers may not match exactly due to revisions in the 1975 estimates of the total population of the State and some counties made after the Experimental Data were produced. However, the percentage distribution for 1975 are the same in the Experimental Data and in this report.

As in Part I, the impact of the Pinelands Moratorium and casino gambling have been incorporated in the projections by age and sex.

Any comments or suggestions regarding these projections by age and sex would be appreciated and would help in the Department's evaluation process.

REVISED POPULATION PROJECTIONS FOR WARREN COUNTY 1/

DREW UNIVERSITY LIBRARY
MADISON, NEW JERSEY

<u>Year</u>	<u>Females 65 Years of Age and Over <u>2/</u></u>		<u>Total Population 65 Years of Age and Over <u>3/</u></u>		<u>Total Females <u>3/</u></u>	
	<u>Current</u>	<u>Revised</u>	<u>Current</u>	<u>Revised</u>	<u>Current</u>	<u>Revised</u>
1970	4,910	4,910	8,400	8,400	38,700	38,700
1975	5,230	5,230	8,700	8,700	42,000	42,000
1980	5,610	6,250	9,400	10,000	45,200	45,800
1985	5,700	7,030	9,700	11,100	47,000	48,300
1990	5,800	7,840	10,200	12,200	48,800	50,800
1995	4,510	8,360	9,300	13,200	49,100	53,000
2000	3,050	8,590	8,100	13,600	49,000	54,500

1/ These numbers represent revisions to those published by this Department in April 1979 in New Jersey Revised Total and Interim Age and Sex Population Projections July 1, 1980-2000. Since county projections are forced to sum to State totals, revisions have not been made to the county total population or to the State totals as this time. The projections methodology is currently under review and revised age and sex population projections for New Jersey and its counties based on 1980 Census results will be published.

2/ Rounded to the nearest ten.

3/ Rounded to the nearest hundred.

NOTE: See footnotes at end of tables.

NOTES

- (1) *The 1970 and 1975 estimates are comparable to the experimental estimates developed by the U.S. Census Bureau. The 1975 estimates were adjusted to reflect this Department's most current totals for that year.*
- (2) *These projections are consistent with those presented in Part I for the ODEA model.*
- (3) *Numbers may not add due to rounding.*
