STATEMENT REGARDING THE METHOD AND USE OF THE 1975
NEW JERSEY COUNTY ESTIMATES BY AGE, SEX, AND RACE
PREPARED BY THE U.S. CENSUS BUREAU

The Bureau of the Census has prepared for the National Cancer Institute experimental population estimates by age, sex, and race for 1975 for all counties in the United States. The New Jersey estimates presented in this report were prepared by a cohort-component technique making separate estimates of births, deaths, and migration by age, sex, and race. The population in 1970 was carried forward by cohort using estimates of births and deaths adjusted so as to agree with registered totals. Migration was first projected from 1970 to 1975 by five year age groups using gross migration rates and proportions for the period 1965-70. The migration data were then adjusted to bring the resulting population into agreement with independent total population estimates for each county developed by the New Jersey Department of Labor and Industry and the U.S. Census Bureau as part of a Federal-State cooperative Program. Additional information on methodology is available from the New Jersey Department of Labor and Industry.*

These estimates were prepared for the purpose of analyzing indices of cancer mortality, and the data may prove useful for that purpose. However, although the results have been screened thoroughly, indicate reasonable patterns, and have been tested against special census and auxiliary data as available, an exhaustive evaluation cannot be made until the 1980 Census counts are available. As a result, the expected accuracy of the data cannot be established with any degree of precision. The race detail especially is problematic, since no independent control by race for each county is available.

Additionally, the Census Bureau's project was to develop county estimates by age, race, and sex, and the method was not designed to produce State numbers. The data were not controlled at the State level and do not add up to other estimates by age being published by the Bureau at the State level. The State estimates in this report represent the sum of the individual counties and are presented here merely as a convenience.

The Bureau of the Census has not published the data, but is considering publication of a technical report focusing on methodology, showing most of the age detail. At present, the Bureau does not plan to publish the race

* The 1975 total county population figures represent intermediate estimates and correspond to those published in the U.S. Census Bureau's Current Population Report, Series P-25, No. 678. The total county population estimates published by this Department in March, 1978 are the revised Federal-State Cooperative figures and as such, differ from the total figures in this report.

estimates in this report, since they are clearly "experimental" in nature. The Bureau cautions users of these statistics that there are undoubtedly counties where substantial errors are involved due to errors and inconsistencies in basic data used.

The New Jersey Department of Labor and Industry, with the consent of the Census Bureau, decided to publish these estimates as "experimental" after a careful study of the Bureau's methodology and a desire to have the State's data-user community share in this Department's review of the estimates themselves. It is expected that county estimates by age, race, and sex will become a continuing part of the Census Bureau's program and that 1976 and 1977 county breakdowns will be available in early 1979.
