ACKNOWLEDGEMENT

This report was prepared by **Dr. Sen-Yuan Wu** of the Division of Labor Market and Demographic Research, New Jersey Department of Labor. Invaluable assistance was provided by the Division's Projections 2005 Team, which is supervised by **Connie O. Hughes**, Assistant Director of Occupational and Demographic Research.

The Division of Labor Market and Demographic Research appreciates the comments and suggestions provided by the demographic and economic experts who participated in the Division's projections focus group meetings. These valuable comments and suggestions were incorporated in the projections as appropriate. The Division's appreciation also goes to the U.S. Bureau of the Census, U.S. Bureau of Labor Statistics, and New Jersey Department of Health for their provision of useful input data to the projections.

The projections focus group meetings were held on November 19, 1992, December 3, 1992, September 8, 1993 and September 10, 1993. The participants of these focus group meetings are listed on the next two pages:

POPULATION AND LABOR FORCE PROJECTIONS FOR NEW JERSEY 1995 TO 2030 (Part B)

INTRODUCTION

This report presents population and labor force projections for the State of New Jersey by county from 1995 through 2010. The projections were developed by the New Jersey Department of Labor, Division of Labor Market and Demographic Research as part of the Division's economic and demographic projections series. Projections prepared by this Division include employment by industry, employment by occupation, population by age-race-sex and civilian labor force by age-race-sex. These projections share input data and assumptions, and are therefore, consistent with each other. The flow chart in Appendix 1 (page 169) illustrates the interrelationship among the Division's 2005 projections. In addition, the data concepts and reconciliation of the projected demographic and economic trends are presented in Appendix 2 (page 170). These data supersede all projections previously issued by this Department.

This report (Volume II, Part B) includes the county-level projections resulting from the Economic-Demographic Model. The concepts, procedures and input data of the Economic-Demographic projection model are described in Appendix 3 (pages 171-174).

New features of these projections, as compared with those released by this Department in 1989, include a more detailed racial category and a new base-year population. These projections are the first demographic projection series based on the 1990 decennial census data. For the first time, the "nonwhite" population is disaggregated into black and "other" races in the projections. The "other" races include Asians, Pacific Islanders, American Indians, Eskimos and Aleuts. The age and race distribution of the April 1, 1990 population is different from that of the census counts because they were modified to be consistent with other data sources. A detailed description of the background and procedures for race and age modifications are presented in Appendix 4 (pages 175-177).

The numbers in this report are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the assumptions and procedures of the method proved to be empirically valid in the future. Projections may assume continuation of past conditions, present conditions, or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgmental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts. Again, numbers in this report are projections, not forecasts.¹

Furthermore, the projections presented in this report are not designated "official" nor "policy" projections; and should not be interpreted as goal or policy oriented. They are not intended to

¹ Donald B. Pittenger, *Projecting State and Local Populations*, Cambridge, MA: Ballinger Publishing Co., 1976; and Richard E. Klosterman, *Community Analysis Planning Techniques*, Savage, MD: Rowman and Littlefield, 1990.

constrain or to advocate specific levels of growth in the state. All series are presented as **baseline**, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen, or undocumented nature or magnitude. They are based primarily on identifiable demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, program evaluation, and considerations for alternative growth scenarios which could be achieved through greater or less resource development.

Presentation of Results

This report provides summary tables for all counties by sex and race as well as the age-race-sex details for each county each projection year. Table 1 provides projected total population in five-year intervals from 1990 through 2010, as well as the 1980 and 1990 census figures (modified). Table 2 provides the projected persons 65 years and over. Tables 3 and 4 provide distributions by sex (male and female) and race (white, black and "other races"). Table 5 contains age-race-sex detail, five-year age groups for population under 65 plus 65-74 and 75 and over, for 1990 and each five-year interval from 1995 to 2010. The same coverage as that in tables 1, 3, 4 and 5 for civilian labor force, 1995 to 2010 are presented in tables 6 through 9 respectively except that labor force is divided into seven, instead of 15 age groups. All projected figures are rounded as appropriate such that there may be small discrepancies between distributions and totals due to rounding.

Caution on Interpretation

As noted at the outset, **projections are not forecasts**. The publication of four series is intended partly to demonstrate the varied nature of projection models. In addition, they are not designated "official" nor "policy" projections. The employment projections by county are available for the year 2005 only (see Volume I, Part B). Particular caution is advised in interpreting results beyond 2005, as the plausibility of historically based assumptions declines with increasing departure from the base year. Projections are by their nature biased in favor of continuity. There is generally little basis for projecting substantial departures from past trends, so few such departures are projected. Yet, there is little doubt that unforeseen changes will occur. In particular, the assumptions in the Economic-Demographic Model including the imposition of constraints on employment growth after the year 2005. The constraints were derived based on current and/or recent conditions that may change dramatically in the future.

The Division of Labor Market and Demographic Research hopes that users of these projections, both interested agencies and individuals, will comment on them. Please direct all comments, suggestions, and requests to New Jersey Department of Labor, Division of Labor Market and Demographic Research, CN 388, Trenton, New Jersey 08625-0388; phone: 609-292-0076.

HIGHLIGHTS FROM THE COUNTY PROJECTIONS

1. Total population is projected to increase in all counties except Essex County between 1990 and 2005.

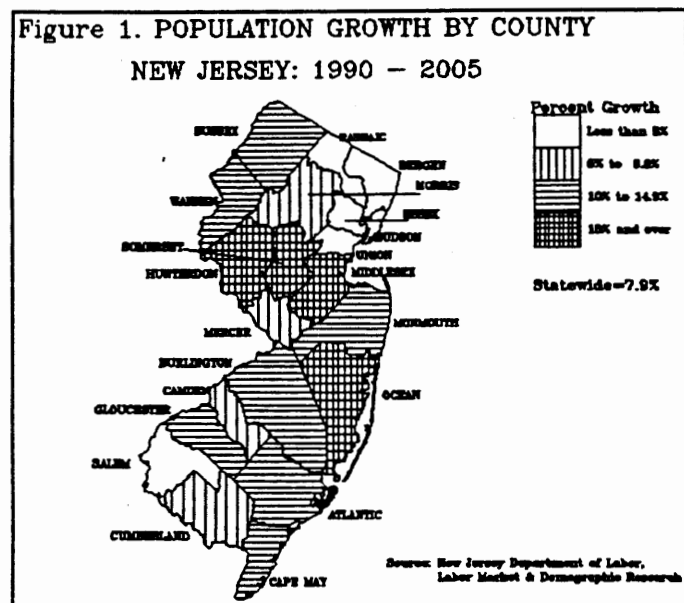

Although the rates of growth vary, all counties except Essex County are projected to increase their population totals. Essex County is projected to have a moderate population decline (-18,200) from 1990 to 2005. With a population size of 67,500 persons, Salem County is projected to be the only county in the State to have a population of less than 100,000 by the year 2005. Cape May and Warren counties also had less than 100,000 persons in 1990, but their total populations are projected to reach 108,000 and 103,300, respectively, by the year 2005. Bergen County was the only county that had more than 800,000 persons in 1990, and is projected to continue to have the largest population among the State's 21 counties. Middlesex County's population is projected to increase by more than 100,000, and will replace Essex County as the second largest county in the State by the year 2005, in terms of total population.

Table A. Total Population by County: 1980, 1990 and 2005

County	Census 1980	Census 1990	Projection 2005	Population Change	
				1980-90	1990-05
New Jersey	7,365.0	7,730.2	8,344.5	365.2	614.3
Atlantic	194.1	224.3	254.6	30.2	30.3
Bergen	845.4	825.4	847.9	-20.0	22.5
Burlington	362.5	395.1	451.6	32.6	56.5
Camden	471.7	502.8	539.3	31.1	36.5
Cape May	82.3	95.1	108.0	12.8	12.9
Cumberland	132.9	138.1	149.0	5.2	10.9
Essex	851.3	778.2	760.0	-73.1	-18.2
Gloucester	199.9	230.1	259.8	30.2	29.7
Hudson	557.0	553.1	564.1	-3.9	11.0
Hunterdon	87.4	107.8	129.6	20.4	21.8
Mercer	307.9	325.8	344.4	17.9	18.6
Middlesex	595.9	671.8	774.1	75.9	102.3
Monmouth	503.2	553.1	615.6	49.9	62.5
Morris	407.6	421.4	448.0	13.8	26.6
Ocean	346.0	433.2	532.5	87.2	99.3
Passaic	447.6	453.1	463.1	5.5	10.0
Salem	64.7	65.3	67.5	0.6	2.2
Somerset	203.1	240.3	282.1	37.2	41.8
Sussex	116.1	130.9	149.0	14.8	18.1
Union	504.1	493.8	500.8	-10.3	7.0
Warren	84.4	91.6	103.3	7.2	11.7

Note: Numbers are in thousands.

2. Ocean, Hunterdon and Somerset counties are projected to continue to be the fastest growing counties. Counties in the northern region of the State are projected to grow much slower than counties in other regions.

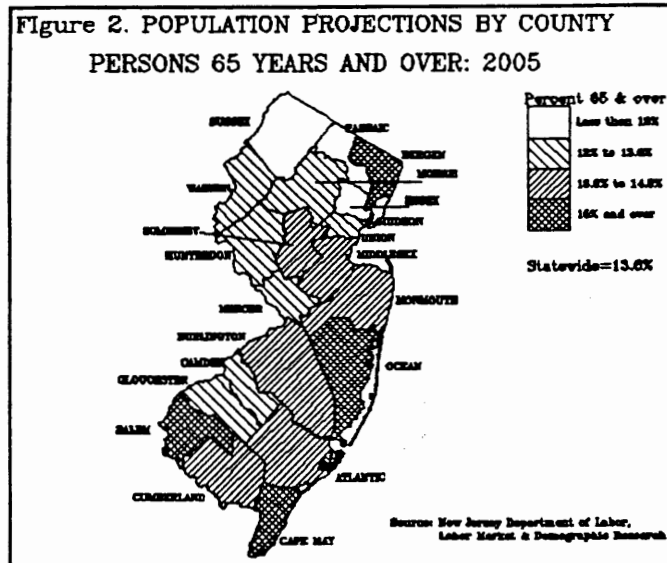

The projected population growth between 1990 and 2005 for each county ranges from -2.3% (Essex County) to 22.9% (Ocean County). Ocean County, Hunterdon County (20.3%), and Somerset County (17.4%) are projected to be the fastest growing counties between 1990 and 2005. These three counties also had the highest 1980-1990 growth rates among the State's 21 counties. The Coastal Region (including Atlantic, Cape May, Monmouth and Ocean counties), with 15.7% growth between 1990 and 2005, is projected to continue to grow faster than other regions; while the Northern Region (including Bergen, Essex, Hudson, Morris, Passaic and Union counties), with a mere 1.7% growth, is projected to have the lowest growth rate in the 1990-2005 period among the State's

five regions. The Coastal and Northern regions also had the highest and the lowest growth rates (16.0% and -2.4%, respectively) between 1980 and 1990.

Table B. Population Growth by Region: 1980-1990 and 1990-2005

Region (counties)	Rate of Growth	
	1980-1990	1990-2005
State Total	5.0%	7.9%
Northern (Bergen, Essex, Hudson, Morris, Passaic, Union)	-2.4%	1.7%
Northwestern (Sussex, Warren)	11.0%	13.4%
Central (Hunterdon, Mercer, Middlesex, Somerset)	12.7%	13.7%
Coastal (Atlantic, Cape May, Monmouth, Ocean)	16.0%	15.7%
Southern (Burlington, Camden, Cumberland, Gloucester, Salem)	8.1%	10.2%

3. Ocean County is projected to continue to have the highest proportion of elderly (persons 65 years and over) in the State. The population 65 years and over is projected to exceed 100,000 by the year 2005 in Bergen County, Ocean County and Middlesex County.

**Table C.
Proportion of Population 65 Years
and Over
Selected Counties: 1980, 1990 and 2005**

County	1980	1990	2005
New Jersey	11.7%	13.3%	13.6%
Ocean	20.8%	23.1%	21.7%
Cape May	20.3%	20.0%	19.0%
Bergen	12.5%	15.2%	16.4%
Middlesex	8.8%	11.6%	14.1%
Sussex	8.7%	8.9%	10.6%
Hudson	12.6%	12.6%	10.2%
Essex	11.6%	12.5%	10.2%

It is projected that approximately 22% of Ocean County residents will be 65 years old and over by the year 2005 while the elderly population is projected to only account for 13.6% of the State's total population. Ocean County also had the highest proportion of elderly residents among the State's 21 counties in 1980 and 1990. On the other hand, Essex County, Hudson County and Sussex County are projected to have a low proportion of elderly population. Less than 11% of these counties' residents are projected to be 65 years old and over by the year 2005. Nearly one-third of the State's elderly population are projected to reside in three counties - Bergen, Ocean and Middlesex by the year 2005. Each of these three counties are projected to have more than 100,000 persons aged 65 and over by 2005.

4. The proportion of nonwhite population is projected to increase in each county between 1990 and 2005. It is projected that 50.7% of the Essex County population will be nonwhite by the year 2005.

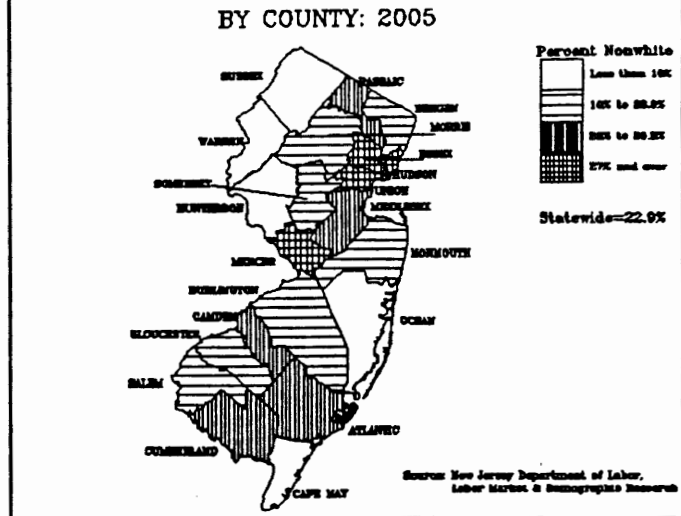

Essex County is projected to continue to have the highest proportion of nonwhite population among the State's 21 counties, and will have more nonwhites than whites by the year 2005. On the other hand, Sussex County is projected to continue to have the highest proportion of whites. The white population will account for 97% of the Sussex County total population by the year 2005. Essex County and Sussex County also had the highest and lowest nonwhite population, respectively, in 1980 and 1990.

The increase of the proportion of nonwhites is projected for all counties. By the year 2005, approximately one-half of the State's nonwhites is projected to reside in four counties -- Essex, Middlesex, Hudson and Bergen. In 1990, Essex, Hudson, Union and Middlesex counties had 50% of the State's nonwhite population.

Table D.
Proportion of Nonwhite Population
Selected Counties: 1980, 1990 & 2005

County	1980	1990	2005
New Jersey	14.3%	17.6%	22.9%
Essex	39.1%	44.4%	50.7%
Hudson	15.9%	22.4%	33.6%
Mercer	19.6%	22.5%	27.9%
Hunterdon	2.0%	3.5%	4.7%
Warren	1.7%	2.4%	3.6%
Sussex	1.2%	2.0%	3.0%

Figure 3. PROJECTIONS OF NONWHITE POPULATION

5. The "Other Races" population is projected to grow substantially faster than their white and black counterparts. Consequently, the proportion of the "Other Races" population will increase substantially between 1990 and 2005 in all counties.

The "Other Races" (Asians, Pacific Islanders, American Indians, Eskimos and Aleuts) grew 148% between 1980 and 1990, and are projected to increase 134% from 1990 to 2005 in New Jersey. Respectively, the white and black populations are projected to grow 1% and 15% in the 1990-2005 period. The uneven growth rates among races is projected for all counties including counties where the proportion of the "Other Races" population has been low, such as Ocean County, Warren County and Sussex County. These counties are projected to continue to have a low percentage of the "Other Races" population although the projected growth rates for the "Other Races" are high.

Table E.
Proportion of "Other Races" Population
Selected Counties: 1980, 1990 & 2005

County	1980	1990	2005
New Jersey	1.6%	3.8%	8.2%
Middlesex	2.2%	6.9%	18.0%
Bergen	2.5%	6.8%	14.8%
Hudson	3.0%	7.1%	14.7%
Sussex	0.6%	1.1%	2.0%
Warren	0.5%	0.9%	1.8%
Ocean	0.6%	1.1%	1.8%

Middlesex, Bergen and Hudson counties accounted for 48.5% of the State's "Other Races" population in 1990. These same three counties are projected to continue to be the loci of the State's "Other Races" population. By the year 2005, 50.8% of the State's "Other Races" population will reside in these three counties.

6. Labor force growth is projected for all counties from 1990 to 2005. Ocean and Hunterdon counties are projected to continue to be the leading counties in terms of labor force growth rates.

Table F.
Labor Force Growth by County
Selected Counties: 1980-1990 & 1990-2005

County	Labor Force Change (000)		Annual Growth Rate (%)	
	1980-90	1990-05	1980-90	1990-05
New Jersey	581.4	481.7	1.5%	0.7%
Bergen	14.5	19.8	0.3%	0.3%
Essex	8.3	7.3	0.2%	0.1%
Hunterdon	17.5	15.7	3.5%	1.6%
Middlesex	72.0	61.3	2.1%	1.0%
Ocean	61.1	68.2	3.9%	2.0%
Union	11.7	12.8	0.4%	0.3%

Labor force is projected to continue to increase in all counties although the growth rates are projected to be slower than that in the 1980s. New Jersey's labor force increased at a rate substantially greater than its population growth rate between 1980 and 1990, due largely to the last of the baby boomers coming of working age. However, the labor force still is projected to grow faster than population in all counties in the 1990-2005 period.

With projected large population growth, both Ocean and Middlesex counties are also projected to have larger labor force growth than other counties. Between 1990 and 2005, Ocean County is projected to add 68,200 persons to its labor force. Middlesex County's labor force will increase by 61,300 over the same period.

Counties that experienced population declines in the 1980s such as Essex, Bergen and Union, had very slow labor force growth between 1980 and 1990. Labor force growth in these counties is also projected to be minimal from 1990 to 2005 -- 0.1% per year for Essex County and 0.3% per year for Bergen and Union counties. On the contrary, Ocean and Hunterdon counties were the leaders in terms of population and labor force growth rates in the 1980s, and are projected to continue to lead in growth rates through the 21st century.

7. The shares of male and white labor force are projected to shrink in all counties.

Table G. Proportion of Nonwhite Labor Force for Selected Counties: 1980, 1990 and 2005

County	1980	1990	2005
New Jersey	12.8%	16.6%	21.9%
Essex	35.0%	43.5%	49.1%
Hudson	14.1%	21.5%	31.2%
Union	16.5%	21.6%	27.5%
Mercer	16.8%	20.2%	26.5%
Warren	1.6%	2.4%	3.9%
Hunterdon	2.1%	1.9%	3.7%
Sussex	1.2%	1.5%	2.5%

Similar to the projected growth pattern for population, the nonwhite, especially the "Other Races" labor force is projected to grow substantially faster than the white labor force between 1990 and 2005. The "Other Races" labor force is projected to increase 139% from 1990 to 2005 while the white and black labor forces are projected to grow 5% and 20%, respectively, in the same projections period. Nonwhite labor force contributed to 40% of the labor force growth in the State between 1980 and 1990, and is projected to account for two-thirds of the State's labor force growth from 1990 to 2005.

Counties with a high proportion of nonwhites in the labor force in 1980 and 1990 -- Essex, Hudson, Union and Mercer are projected to continue to have a high percentage of nonwhites in their labor forces by the year 2005. The proportions of nonwhites in the labor force in Warren, Hunterdon and Sussex counties are projected to continue to remain low.

Females constituted 45.9% of the State's labor force in 1990, and are projected to account for 47.5% of the State's labor force by the year 2005. The proportion of females in the labor force ranged from 43.5% in Sussex County to 47.9% in Essex County in 1990. Both Sussex County (45.7% female) and Essex County (49.2%) are projected to continue to have the lowest and highest percentages, respectively, of females in the labor force by the year 2005.

Note: The "Other Races" labor force in 1990 was too small (<5,000) to produce reliable projections by age-race-sex. Nonwhite is the aggregate of black and "Other Races", which include Asians, Pacific Islanders, American Indians, Eskimos and Aleuts. Hispanic origin is not a race. Persons of Hispanic origin may be of any race. Numbers may not add due to rounding.

APPENDIX 2

DATA CONCEPTS AND RECONCILIATION

Nonfarm Salary and Wage Employment: The industry employment projections are for nonfarm wage and salary employment. This employment series is by place of business and is based on company or establishment payroll data. This is the employment definition used in the Division's Current Employment Statistics (CES) program.

Occupational Employment Estimates and Projections: The occupational employment estimates and projections represent occupational employment by place of business. The employment definition is nonfarm wage and salary employment given above plus estimates of self-employed and unpaid family workers.

Resident Employment: Resident employment is employment by place of residence as opposed to place of work. Total resident employment includes wage and salary employment, self-unemployed, unpaid family workers, domestics, and total agricultural employment.

Unemployed: Persons who are not currently employed but are looking for and are available to accept jobs.

Civilian Labor Force: All civilians (persons who are not members of the Armed Forces and are not institutionalized) 16 years old and over who are employed or unemployed.

Demographic and Economic Trends					
New Jersey: 1990-2005					
(Number in Thousands)					
	1990	2005	Change: 1990-2005		
			Number	Percent	
				Total	Annual
Workplace Employment					
Nonfarm Wage and Salary Employment (Industry)	3,642.5	4,151.5	509.0	14.0	0.9
Self-employed and Unpaid Family Workers	220.9	248.6	27.7	12.5	0.8

Unemployment Rate	5.0%*	5.4%			
Resident Employment	3,868.7	4,340.0	471.3	12.2	0.8

* All of the 1990 population and labor force data, except the unemployment rate, are as of April 1, 1990 from the decennial Census.
The 1990 unemployment rate is an annual average. All of the 2005 data are annual averages.

APPENDIX 3

THE ECONOMIC-DEMOGRAPHIC PROJECTION MODEL

The projections of population and labor force by a county were prepared based on the Economic-Demographic model. The Economic-Demographic Model is based on standard demographic projection procedures, but assumes employment growth to be the major determinant of migration in and out of the state for persons under 65 years of age. The model is therefore driven primarily by labor demand in the state, which is estimated based on the 2005 employment projections prepared by this Division. After 2005, employment growth was constrained significantly below the 1990-2005 rates, to rates consistent with projected levels of national immigration, settlement patterns of immigrants from abroad, and the state's relative capability of attracting job-seekers from elsewhere in the nation. Low fertility rates and the entrance of the "baby boom" into retirement -- in the absence of loosening of immigration quotas or other unforeseen events -- can be expected to constrain employment growth. Of course, economic growth might not be restricted even if employment growth were constrained, if productivity increased sufficiently. But, in terms of the model, labor supply constraints at the national level would restrict state employment and population growth after 2005, in spite of the basic demand orientation of the model. A flow-chart showing the algorithm of the Economic-Demographic Model is presented at the end of this Appendix (page 174).

The Cohort-Component Method

The basic projection procedure used in this model is known as the cohort-component method. For each five-year cycle of the projections, a base population distribution by age, race, and sex is "aged" five years. Each five-year age group is reduced through a survival ratio to account for mortality during the five years. Births are computed by applying five-year age-race-sex-specific fertility rates to the female age groups from 10 to 49. After adjustment for mortality through a survival ratio, the five years of births become the projected group 0 to 4 years of age. Net migrants are added to the resulting projected population by age, race, and sex. This procedure is repeated for each five-year interval in the projection period. Specific inputs and their methods of development are discussed separately below.

Base Population

The base population used in the Economic-Demographic Model is taken from the decennial census of April 1, 1990, which provides resident population by age, sex, and race. Age is defined by five-year groups from age 0 to age 64, plus 65-74 and an open category for age 75 and over.

According to the U.S. Bureau of the Census, there was an age-reporting problem in the 1990 census. As a result, the age of approximately 26% of the persons under one year old was misreported in New Jersey. In addition, 275,407 persons in New Jersey were enumerated as other (not specified) races in the 1990 census. These people were not included in any of the 15 racial categories listed on the census form, but were included in all race-related tabulations. In order to meet the

needs of many users of census data, the race statistics were modified to be consistent with the classification used in data sets other than the census, and the age data were adjusted to correspond with the April 1, 1990 census date. The "modified" data were released by the Census Bureau as the 1990 census MARS (Modified Age-Race-Sex) files and were used in preparing the national population and labor force projections. The background and procedures for the age and race modifications are described in Appendix 4 (pages 174-178). Appendix 4 also includes a juxtaposition of the population by race and age group by county based on the 1990 census and the 1990 MARS data for comparison.

The age-race-sex distribution of each county's population based on the 1990 census MARS data was projected to 1995, and adjusted to be consistent with the provisional 1991 population estimates. Thus, the base population reflects the demographic characteristics of the latest decennial census and the recent trend.

Fertility and Mortality

Age-specific fertility rates by race were used to compute births to women in each five-year interval. The fertility trend was determined from the national "middle series" projections of fertility by age and race of mother. Rates for each county were adjusted to reflect the relationship of the county rates to the national rates in 1990. In the national projections, very little change from the current "high" fertility level is projected, and no convergence of rates among races is assumed.¹ Projected county births are controlled to the projected statewide figures.

Similar reasoning was used in the projection of mortality. County survival ratios by age, race, and sex were projected on the basis of the U.S. Census Bureau's "middle mortality assumption" for the nation, and incorporating the recent mortality differences between each county and the nation. Projected county deaths are controlled to the projected statewide figures. The source of the county births and deaths data is the New Jersey Department of Health.

Migration of Persons Under 65 Years of Age

Projected migrants of persons of working age and children are based on the projected civilian labor market, and constitute the assumption that distinguishes this model from purely demographic models. In simple terms, an over-supply of labor relative to demand for workers results in a net out-flow of persons from the state while high demand relative to supply results in a net in-flow of migrants. Net migration is therefore based on the size of the civilian labor force needed to balance the labor market.

¹ According to U.S. Census Bureau, the previous national projections (published in 1989, P-25 No. 1018) assumed a decrease in the total fertility rate to 1.8 births per woman and a convergence of fertility among race groups. However, since the late 1980s, after a relatively stable 15-year trend of low fertility, there has been a dramatic rise in total fertility levels to almost 2.1 births per woman. The projections of fertility rates are thus revised up to reflect the current trend. The convergence of fertility among race groups is no longer assumed in the revised projections because there is little evidence to support the convergence assumption.

Labor supply is estimated by applying projected labor force participation rates to civilian persons 16 years of age and over in the population projected without migration (i.e., the "survived closed population"). These rates are based on national labor force projections by age, race and sex produced by the U.S. Bureau of Labor Statistics until 2005. The increase/decrease pattern for each age-race-sex group projected between 1990-2005 is assumed to continue after 2005, but at a slower pace.

Labor demand is determined by employment projections adjusted to a residence basis and the projections of unemployment rates. Employment projections reflect the historical growth of industries in the county and the projected growth by industry at the state and national levels. Population from the preliminary projections were also input to the 2005 employment projections for certain industries. After 2005, the county employment levels were assumed to grow substantially below its 1990-2005 rates, to rates consistent with projected levels of national immigration, settlement patterns of immigrants from abroad, and the county's relative attractiveness to job-seekers from elsewhere in the state and the nation. Such a constraint implies a lower rate of employment growth than historic trends would indicate. However, such constraints were imposed due to existing national immigration policy, expected relative demand for labor from elsewhere in the nation, low fertility rates, and the aging of the baby boomers. Adjustment of employment to a residence basis is necessary due to commutation across state boundaries.

Finally, net migration of the labor force is determined by the balance of demand and supply, allowing a level of unemployment projected for the county. The resulting labor force net migrants are inflated to include children and adults under 65 years old who are not in the labor force, and are distributed by age, race, and sex according to the projected labor force participation rates and migration patterns of the 1980s.

Migration of Persons 65 Years of Age and Older

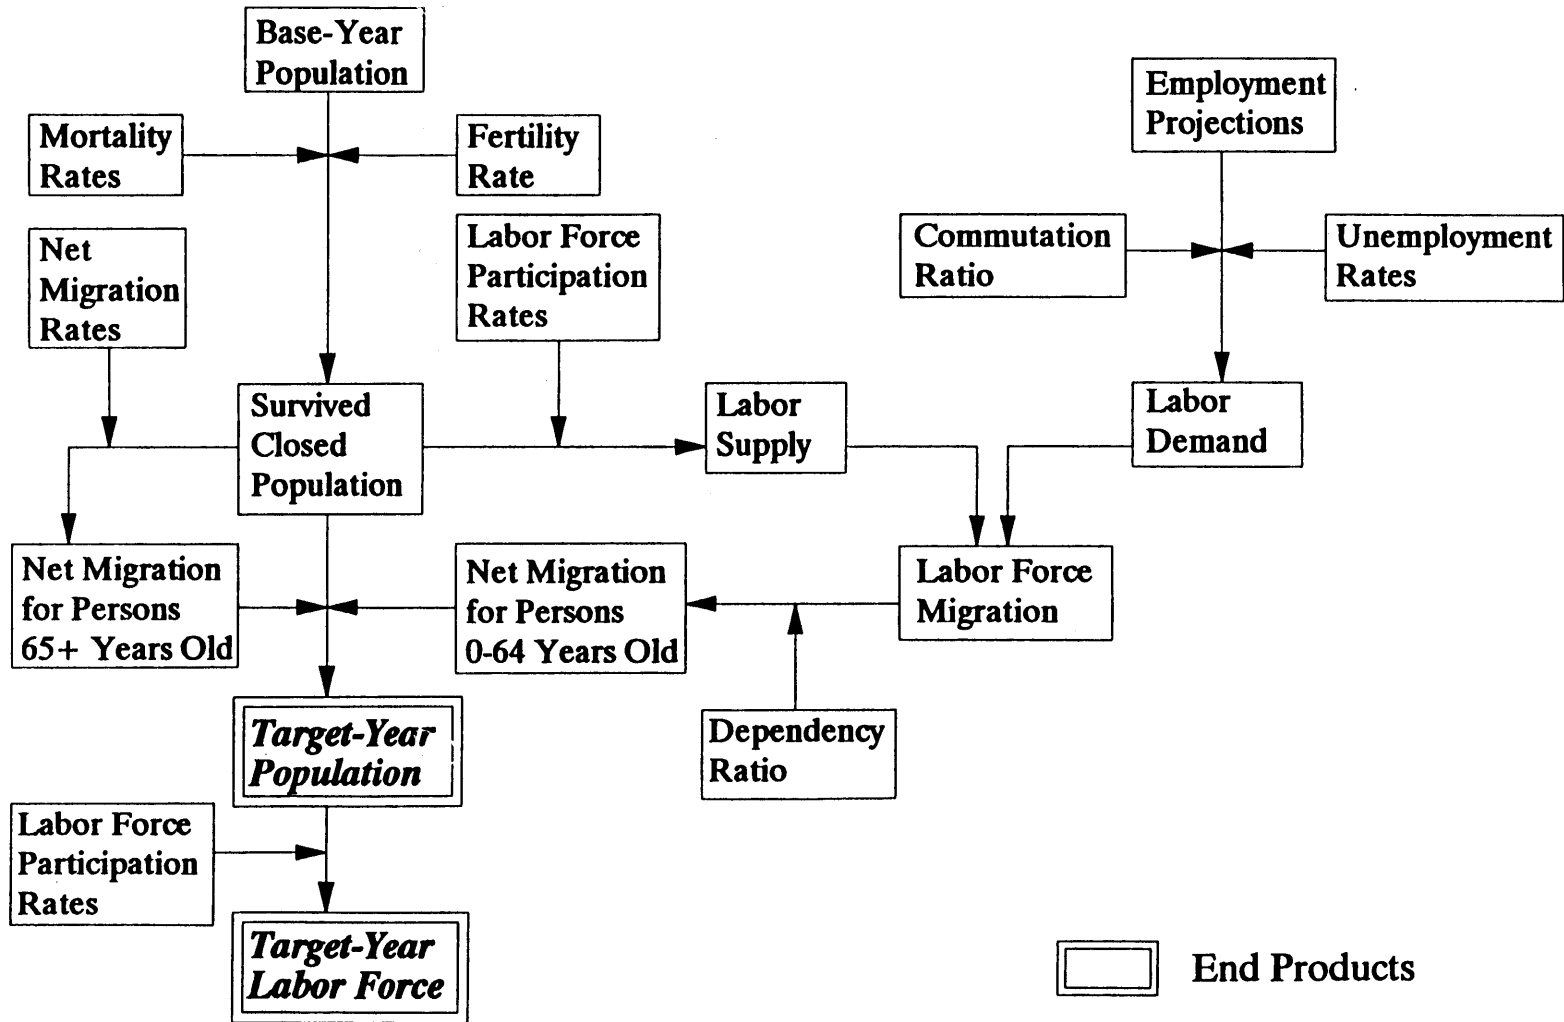

Migration patterns of persons 65 years of age and over are assumed to follow their migration patterns estimated based on the 1980-85 and 1985-90 data. Rates by age, race, and sex were inferred from the five-year change in birth cohorts, and by an adjustment to the revised 1985 estimates of the population 65 and over.

CIVILIAN LABOR FORCE PROJECTIONS

Projected civilian labor force is obtained by applying the projected age-race-sex specific labor force participation rates to the civilian population aged 16 and over derived from the Economic-Demographic Model. The non-civilian population in New Jersey are assumed to be constant at its current level through the projection period. The projections of total population and labor force participation rates were discussed in the previous sections of this report. Definitions of Labor Force and Participation Rates in this report follow that of the decennial census, which differ slightly from those used in the U.S. Bureau of Labor Statistics' (BLS) publications. Numbers published by BLS are based on annual averages computed from sample surveys (i.e., Current Population Survey), which were taken by trained interviewers while census data were reported by individual respondents and cover all civilian population.

APPENDIX 4

1990 CENSUS RACE AND AGE MODIFICATION

Source: Technical documentation of the 1990 Census of Population and Housing: Modified Age/Race, Sex and Hispanic Origin (MARS) State and County File [machine-readable data file] [conducted by the Bureau of the Census. - Washington: The Bureau [producer and distributor], 1992

RACE MODIFICATION

Nationally, there were 9,804,847 "Other race" persons included in the 1990 census. These people were not included in one of the 15 racial categories listed on the census form. The existence of this group is inconsistent with the race categories defined by the Office of Management and Budget in OMB Directive 15. Such "non-specified" race persons also are not found in data sources other than the census. In order to serve the needs of some portions of the user community it is necessary to assign each of these persons to a specified race.

After evaluating many alternatives, the following race assignment rule was used: Assign each "Other race" person to the specified race reported by a nearby person with an identical response to the Hispanic origin question. The only alternative specifications which yielded significantly different National results were those where responses to the Hispanic origin question were ignored during the assignment of race. This work was done separately for each of the 449 district offices.

Background Information on the Race Assignment Rule

1. The specific Hispanic origin of each "Other race" person in the 1990 census was taken into account when assigning them to a specified race. This was considered appropriate because over 95 percent of the "Other race" persons were of Hispanic origin. Their origin response was used, whether or not it had been allocated, in order to preserve the race distribution within each type of origin. The specific Hispanic origin responses were "not Spanish/Hispanic, Mexican, Puerto Rican, Cuban, and other Spanish/Hispanic".

2. Virtually every person who reported both a specified race and an origin was included in the "donor pool" of eligible persons. The sole exception was the exclusion of several non-specific American Indian codes from the donor pool since: 1) preliminary 1990 research suggested questionable reporting in the American Indian category and; 2) previous research showed that a high proportion of such persons were much less likely to be American Indians than those who actually provided a specific tribe response as instructed on the census form. These codes were: 548--Amerind White, 549--Amerind Black, 597--American Indian (no tribe reported), 598--American Indian (tribal responses not elsewhere classified), and 973--FOSDIC circle with no write-in response. These were excluded because of evidence from the 1980 census that misreporting of race was much higher in these codes than it was in codes representing specific American Indian tribes. Consistent with

advisory committee recommendations, any person assigned to the American Indian race through allocation was given code 973 rather than a specific tribal code.

3. The assignment of a specified race was made on an individual basis. That is, no effort was made to minimize racial heterogeneity within households. Any such attempt would have made it difficult to assign race in a manner which approximated the specified-race distribution reported by persons with the same Hispanic origin response.

4. The race, origin, or sex of some persons also changed as a result of the assignment of a different age to them during the application of the age modification procedures. Their changed age sometimes caused the person to be allocated a different relationship and/or sex which resulted in the person receiving their race or origin from a different person in the household (Since those items were allocated according to a hierarchy of relationships).

5. The results of the race modification procedures were overridden in four counties where the American Indian population grew by more than 100 percent and also became at least one percentage point more of the county's population: Adams County, Washington; Harmon County, Oklahoma; Clark County, Idaho; and Washington County, Idaho. In each case the persons were made White.

6. In most census allocation procedures, acceptable data from eligible persons (donors) are far more common than are the cases where the value is assigned to persons without the characteristic (the donees). This means information from any given donor is rarely used more than once. However, such large donor-to-donee ratios were not usual here. There were a number of occasions where those needing a specified race outnumbered those who reported the same origin as well as a specified race.

Special procedures were adopted to minimize the distortions produced by such low ratios of donors to donees in some cells of these matrices. The most important change was to expand each cell of every allocation matrix to hold 64 values, rather than the 8 stored in most 1990 census matrices. For each district office, the initial race data were then obtained by running the actual census file and storing up to the first 64 acceptable cases in each data cell. If the district office did not have 64 cases the remaining values were assumed to be White. After the matrices were so "warmed", the program went back to the beginning of the data and began the race assignments. The actual race assignment was a random selection from the unused values within each cell. If all 64 values had been used, then assignment was random from among all 64 until new acceptable cases were available. Used values in a cell were replaced with acceptable data in reverse of the order of use.

AGE MODIFICATION

The following is a portion of the text of a user note which is incorporated in 1990 census products. It explains why the data were modified.

"Age Reporting--Review of detailed 1990 information indicated that respondents tended to provide their age as of the date of completion of the questionnaire, not their age as of April 1, 1990. In addition, there may have been a tendency for respondents to round up their age if they were close to having a birthday. It is likely that approximately 10 percent of persons in most age groups are actually 1 year younger. For most single years of age, the misstatements are largely offsetting. The

problem is most pronounced at age 0 because persons lost to age 1 may not have been fully offset by the inclusion of babies born after April 1, 1990 and because there may have been more rounding up to age 1 to avoid reporting age as 0 years. (Age in completed months was not collected for infants under age 1.)

The reporting of age 1 year older than age on April 1, 1990 is likely to have been greater in areas where the census data were collected later in 1990."

About 95 percent of the population provided acceptable birth year responses which were adjusted with the following procedures. The age data for individuals in households were modified by adjusting the reported birth year data by race and sex for each of the 1990 Census' 449 district offices to correspond with the national level quarterly distribution of births available from the National Center for Health Statistics. The data for persons in group quarters were adjusted on a state basis to minimize the number of matrix cells with very small numbers. The central assumption in this procedure is that there is no reason for the residents of any subnational area to have a different quarter of birth distribution from that found at the national level. It was also assumed that there are no significant birth place-sex-race-origin differences in annual birth distributions by quarter, that all those born before 1920 have the same quarter of birth distribution, and that mortality is not selective by quarter of birth. Approximately 100 million persons have an age in this modified file which is one year different from that they had in the 1990 census.

The modification procedure was done separately for each birth year, by sex, for the White; Black; Asian or Pacific Islander; and American Indian, Eskimo, or Aleut populations. For every birth year the program was provided with the number of cases out of 10,000 where the birth year plus the person's age should equal 1989 (most years that number was close to 7,500). These overall control values were calculated from the available monthly birth statistics for the 1920 to 1989 period. Earlier birth years were each assumed to have the same seasonal pattern as was exhibited by the unweighted average of the 1920-24 birth cohorts. Each sex-race-origin cell was next randomly assigned a value of 0, 0.25, 0.5, or 0.75. Then, each time that birth year cell was encountered, a test was made to see if that birth year plus the person's age should equal 1989 or 1990. The choice of an age was dependent on whether its acceptance moved the cell's actual population distribution toward the control value distribution.

MODIFIED AGE-RACE-SEX (MARS) DATA BY COUNTY

The 1990 census enumerated counts by race and age group and the 1990 MARS data for the 21 counties in New Jersey, prepared by U.S. Bureau of the Census based on the aforementioned procedures, are juxtaposed on the following 21 pages (pages 178-198).

Technical questions regarding the race and age modification procedures should be directed to David L. Word and/or Gregory Spencer of the U.S. Census Bureau; telephone: 301-763-1739/301-763-1902.
