The offices of the Department are in the State House, Trenton

STATE OF NEW JERSEY,
DEPARTMENT OF HEALTH,
TRENTON, N. J., August 16, 1933.

To the Senate and General Assembly of the State of New Jersey:

As required by law, I have the honor of submitting herewith the Annual Report of the Department of Health, together with accompanying important documents, for the fiscal year ending June 30, 1933.

CHARLES I. LAFFERTY,
President,
State Department of Health.

STATE OF NEW JERSEY,
DEPARTMENT OF HEALTH,
TRENTON, N. J., August 16, 1933.

To the Department of Health of the State of New Jersey:

GENTLEMEN—I have the honor to submit herewith the Annual Report of the Department for the year ending June 30, 1933. The reports of the Bureau Chiefs will give comprehensive accounts of the activities of the ten Bureaus of the Department during the year.

Respectfully submitted,
J. LYNN MAHAFFEY, M.D.,
Director of Health.

Report of the Director of Health

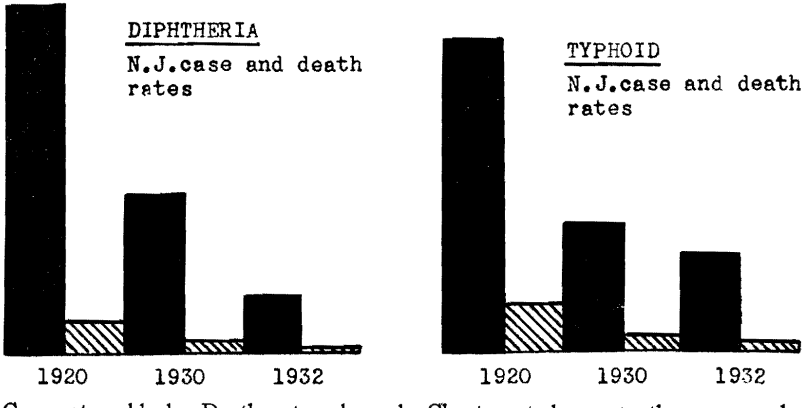
J. Lynn Mahaffey, M.D.

The year which ended June 30, 1933, witnessed reduction of the case and death rates for tuberculosis, typhoid fever and diphtheria, and also the infant mortality rate, to new low records for New Jersey.

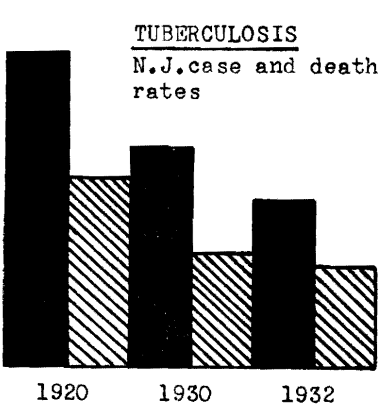
The year was marked by the application of a new and far-reaching milk control law which the State Department of Health was delegated to enforce; by the enlargement of the laboratories and other quarters of the Department; by a significant increase in the use of services offered by its various bureaus; and by the enactment of new laws which will affect public health work in this State in the future.

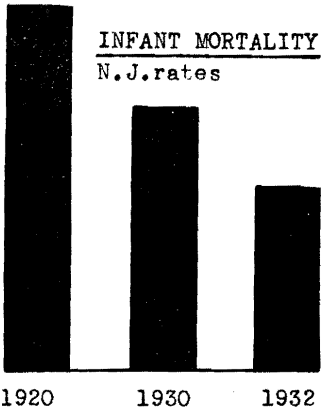
In addition, progress in many lines of endeavor which form the routine work of the Department was conspicuous. These and other matters are described in detail in the reports of the 10 bureaus into which the Department is divided for administrative purposes. Mention of some of the more important of them is made here.

The continued downward trend of diseases for which preventive measures are available proves that these means are being applied intelligently and to a creditable extent. If one doubts the beneficent effects of sanitation or would have proof of the value of preventive medicine and hygiene, the four charts which follow should be convincing.



Case rates—black. Death rates—barred. Charts not drawn to the same scale.





N. J. CASE, DEATH AND INFANT MORTALITY RATES PER 1,000

	Diphtheria		*Typhoid*		*Tuberculosis*		*Infant*
	Case Rate	*Death Rate*	*Case Rate*	*Death Rate*	*Case Rate*	*Death Rate*	*Mortality Rate*
1920	2.19	.18	.20	.03	1.91	1.14	87.3
1930	1.02	.08	.08	.01	1.30	.69	56
1932	.33	.02	.06	.006	1.07	.60	50

The law regulating the production, handling, importation and distribution of milk, cream and milk products in New Jersey (Chapter 131, P. L. 1932) placed an immense amount of additional work upon the Department. The act made necessary among other things the approval, following inspection by some New Jersey public health official, either State or local, of every dairy and milk plant from which milk and cream to be used in the fluid state is shipped into New Jersey. Subsequently it was found that some 35,700 dairy farms and 319 milk plants located in the States of New York, Pennsylvania, Delaware and Maryland were included in this group.

To inspect these places within the time specified was impossible. In order that milk distributors might not be forced to violate the law by importing milk without the required permit, temporary permits were issued, based on the affidavits of the distributors that the provisions of the law had been complied with. It soon became evident that some had deliberately sworn to falsehoods for the purpose of securing permits. Where this was proved, tem-

porary permits were revoked and applications for permits rejected. Word that false statements were likely to result in failure to obtain a permit soon spread and had the desired effect. Of the 137 permits issued to transport milk into the State, 14 have been revoked.

This law set forth minimum standards under which milk produced within, as well as without New Jersey, was to be produced. Inspections of dairy farms and milk plants in this and other States have been carried on as rapidly as possible, numerous local health departments cooperating in this work. A general attempt to comply with the requirements of the act has been found.

Adequate space for the laboratories of the Department has been acutely needed for many years. During the past year this need was met by the State House Commission when it provided office space for four of the bureaus of the Department on the second floor of the capitol building and converted the rooms thus vacated on the fourth floor into additional laboratory quarters. For the first time in more than a decade, the exacting tests performed in the bacteriological, serological and the water and sewage laboratories can be carried on in a satisfactory manner.

This enlargement of quarters permits additional service to be rendered. A 57 per cent. increase in the number of samples of water and sewage tested took place last year. Wassermann tests for evidence of syphilitic infection continue to mount in numbers, over 41,000 being examined in this 12-month period. Additional employees will be needed in these branches before many more tests can be performed.

Chapter 175, P. L. 1933, placed upon the Department the duty of licensing some 10,000 barbers now practicing their trade in New Jersey, the examination of other barbers desiring licenses, and the inspection of barber shops. This work, which will be supported to a large degree by the fees collected, created a new regulatory activity. Since the act was passed at the request of the barbers, their cooperation in securing its strict enforcement should follow.

An important change in the venereal disease law puts upon a rational basis the period during which syphilis and gonorrhea are considered infectious. This time will now be determined by the physician treating the case rather than by the faulty arbitrary standard set forth in the old law. The local health officer has been given power of review and the right to have the final decision made by a physician of his choice.

The outbreak of poliomyelitis which occurred in the late summer and the autumn of 1932 resulted in 339 cases and 38 deaths from this disease. Unlike the much larger epidemic of the previous year which centered in the northern metropolitan area, most of the cases were in the southern counties. Some 15,000 cubic centimeters of blood for making convalescent immune serum were obtained from 38 volunteers who had previously had infantile paralysis. These persons were paid ten dollars apiece later in the year from a special fund provided for dealing with the epidemic. The serum thus obtained, together with that remaining from 1931, was sufficient to meet all requests for treatment and also for use on some exposed children with the hope of creating immunity. Whether or not this was effective could not be ascertained due to the small numbers and lack of proper controls.

Advance toward higher standards of public health is indicated in various acts of the Department during the year and by the results of policies adopted in the past. Some of these are set forth in the following paragraphs.

Reclassification of water purification and sewage disposal plants for purposes of licensing operators and the adoption of definite qualifications, based on training and experience, which must be met by applicants for licenses, were approved by the Department. It is now possible to be more nearly sure that an applicant is qualified to assume responsibility for the operation of these important public safeguards and he can be examined with special reference to the type of purification or treatment unit to which he will be assigned.

Minimum standards of sanitation to be observed at roadside stands, restaurants, soda fountains, lunch rooms and similar places were adopted by the Department. These are not regula-

tions, but are based upon provisions of existing laws and the State Sanitary Code. The standards will serve as a guide to local and State health officials and also to proprietors of eating places.

An audiometer was purchased for renting to schools not equipped with such an instrument. By means of this service, delicate tests to detect cases of defective hearing can be made, even in small communities. In the few months this instrument has been in use, more than 25,000 children were tested.

The Department cooperated in applying scientific methods for detecting and curing cases of syphilis to a large food industry, resulting in the diagnosis of 125 cases of this disease among the workers. Arrangements were made locally whereby these persons obtained treatment until rendered non-infectious.

Advanced courses for midwives which have been conducted since 1927 with the help of the Department have resulted in 147, or 40 per cent., of the supervised midwives of the State receiving one month's training in a maternity hospital.

Sampling stations were established at 204 points along rivers and streams throughout the State. Tests of samples collected at regular intervals will assist in protecting public water supplies, recreational centers, fish life, waters used for agricultural purposes, for industries and manufacturing as well as determining sources of pollution.

A striking improvement in coastal waters which was due directly to departmental action was revealed by tests of the surf at 60 northern bathing beaches. As a result of requiring chlorination of sewage plant effluents which discharge into the Atlantic Ocean in this section, B Coli in the surf were reduced 98 per cent. in four years. Tests of the water in 1928, before chlorination was required, showed the average number of B Coli present to be 56.7 per cubic centimeter on ebb tide and 49 on flood tide. In 1932 the average numbers were 0.84 per cubic centimeter on split tide, ebb and flood, and 0.54 on flood tide.

Certain portions of Sandy Hook Bay were reopened for the harvesting of clams following a series of tests of the waters of the condemned area. Although this improvement in sanitary

quality was not due to action taken in New Jersey it was gratifying to be able to lift restrictions on a large and important section of shellfish grounds.

By transferring the water and sewage laboratory from the Bureau of Engineering to the Bureau of Chemistry, the chemists of the Department can be employed to better advantage, especially at seasons when a peak load is carried by one or another branch of this division.

Other evidence of progress included the repair of old and valuable records of births, marriages and deaths, improvement in the sanitation of many roadside stands in rural sections following inspections by district State health officers and the defining by the Department of a public potable water supply as one serving eight or more houses or properties.

The public was given information and instruction on timely public health matters through press releases. Owing to the lack of appropriations, the monthly bulletin of the Department, Public Health News, was not published during the fiscal year.

Certain new aspects of public health and welfare have been brought to light. Dog bite is now reportable to local health authorities and the record for the first year shows 7,809 reported bites in 1932. It is improbable that this is a complete record. Had 7,000 persons been bitten by wild animals or any other domestic animal the menace would long since have aroused public ire and have been abated. How much longer will we tolerate being attacked to this extent? Nor is this the whole story.

Among the dogs that did this wholesale biting were 222 affected with rabies, wild animals of a most dangerous kind. Three bitten persons died of rabies. Sufficient authority exists to deal with this situation, but not until public opinion demands that dogs, as well as other animals, be kept under control are we likely to see the end of such needless suffering.

Cross connections between public water supplies and unapproved supplies may not be maintained legally in New Jersey except by permit issued by the State Department of Health. Enforcement of this regulation, which is embodied in Chapter 13 of the State Sanitary Code, is a duty of local boards of health. Since

1929, when this rule became effective, permits have been issued for 133 connections of approved types at factories in 56 municipalities. A list of these connections is given in the report of the Engineering Bureau.

There follows a list of articles of food held in cold storage for twelve months and for which an extension of time was granted by the Director of Health. This list is published as required by Chapter 101, P. L. 1916.

Section 8, Chapter 101 of the Laws of 1916, provides that the Director of Health shall extend the period of storage beyond twelve months for any particular article of food, providing the food is found to be in proper condition for further storage. A report of each particular lot of food on which extensions were granted shall be included in the annual report of the Director of Health. During the year from July 1, 1932, to June 30, 1933, extensions of time were granted for the storage of food in cold storage as follows:

Article	*Quantity*	*Date of Storage*	*Period of Extension*
Cheese	1,000 boxes	July 9, 1931	2 months
Cheese	1,000 boxes	July 10, 1931	2 months
Cheese	950 boxes	July 21, 1931	3 months
Cheese	20 boxes	Aug. 7, 1931	3 months
Cheese	90 boxes	Aug. 11, 1931	3 months
Cheese	252 boxes	Oct. 26, 1931	3 months
Cheese	500 boxes	Dec. 1, 1931	3 months
Cheese	321 boxes	June 1, 1932	3 months
Frozen Eggs	76 30-lb. cans	Oct. 21, 1931	3 months
Frozen Eggs	118 30-lb. cans	April 11, 1932	3 months
Frozen Eggs	3,453 30-lb. cans	April 26, 1932	3 months
Frozen Eggs	351 30-lb. cans	May 1, 1932	3 months
Frozen Eggs	528 30-lb. cans	May 16, 1932	3 months
Poultry	24 boxes	Oct. 15, 1931	1 month
Poultry	11 boxes	Nov. 30, 1931	1 month
Poultry	21 barrels	Dec. 9, 1931	1 month

Report of Bureau of Administration

For the Year Ending June 30, 1933

CHARLES J. MERRELL, CHIEF

Irvin E. Deibert, M.D., whose term as a member of the Department expired on July 1, 1933, was re-appointed by Governor Moore for a full term of four years. The term of Colonel Frank S. Tainter also expired on July 1, 1933. Colonel Tainter was not re-appointed, but Clyde Potts, C.E., who previously served for a number of years as a member of the Department, was again appointed for a term of four years in place of Colonel Tainter.

At the meeting of the Department on July 11, 1933, Mr. Charles I. Lafferty was re-elected President and Miss Margaret L. MacNaughton was elected Vice-President of the Department for the coming year.

During the past year the Department lost a very efficient and faithful employee through the death of Mr. A. I. Goehrig, Special Investigator in the Bureau of Food and Drugs, who passed away after a brief illness on April 22, 1933. Mr. Goehrig was connected with the Department for twenty-nine years, and he also served as a member of the Board of Examiners of Health Officers and Sanitary Inspectors for a period of eight years.

At the meeting of the Department held on May 2, 1933, the following preamble and resolution was adopted:

WHEREAS, The State Department of Health has sustained a serious loss in the death of Avellino I. Goehrig, Special Investigator in the Bureau of Food and Drugs; and

WHEREAS, Mr. Goehrig was a most loyal, able and conscientious worker and was a leader in this country in the inspection and supervision of food establishments and milk pasteurizing plants; and

WHEREAS, In the passing from life of such a Christian gentleman we feel the loss of his personal contact, and we shall cherish a deep appreciation of his attainments in improving the milk supply of this State, and a profound respect for his many human tendencies of sympathetic understanding; now, therefore,

Be it Resolved, That this Department extends its most sincere sympathy to the family of Mr. Goehrig.

Mrs. Ella C. Closson, Senior Clerk in the Bureau of Vital Statistics, retired on September 1, 1932. Mrs. Closson, who was seventy-six years of age, had been employed in said bureau for forty-two years. Mrs. Closson was one of the first persons employed in the State Department of Health and rendered a loyal, efficient and faithful service to the Department during this long period of years.

Harold J. Harder, C.E., a former member of this Department, passed away on March 16, 1933, and the Department, at its meeting on May 2, 1933, adopted the following preamble and resolution:

WHEREAS, Harold J. Harder, of Paterson, New Jersey, served as a member of the State Board of Health from May 1, 1920, to July 1, 1932, and as its Vice-President from July 1, 1929, to July 1, 1932; and

WHEREAS, In this service he brought to the use of the Board a broad experience in his chosen profession of civil engineering, an intimate knowledge of the varied public health aspects of the work of the Department, faithful attention to his responsibilities as a public official and regular attendance at stated and special meetings of the Board; and,

WHEREAS, He exhibited to his confreres on the Board an unfailing courtesy of demeanor and a most unselfish and helpful cooperation in his personal and official relationships; therefore,

Be it Resolved, That the members of the Board of the State Department of Health feel that the Board and the individual members thereof have sustained an irreparable loss in the death of their associate and desire to express their grief in his passing and their sympathy with his bereaved family; and,

Be it Further Resolved, That a copy of this resolution be spread in full upon the minutes of the Board and that another copy be sent to Mrs. Harder.

APPROPRIATIONS

For the year ending June 30, 1933, the Department was granted an appropriation by the Legislature of $429,646.06. The appropriation granted for the year ending June 30, 1934, is $411,392.52, which is $18,253.54 less than the appropriation for the

preceding year. The appropriation granted the Department for the year ending June 30, 1932, was $539,708.50.

In addition to this, the Department is charged with the enforcement of the following four new laws entailing considerable expenses:

Chapter 175, an act to regulate the occupation of barbering.

Chapter 186, an act defining and relating to narcotic drugs, making uniform the law with relation thereto and providing penalties for violations thereof.

Chapter 243, an act regulating the production, handling, sale and distribution of milk, cream and milk products.

Chapter 271, an act to regulate the manufacture, handling, sale and distribution of ice cream, sherbets or ices.

It is provided by the appropriation law that fees received for milk permits in the enforcement of Chapter 243 shall be credited to the Department for carrying on this work. In the case of Chapter 175, regulating the occupation of barbering, it is provided that $10,000 of the amount received from the barbers for licenses and certificates issued shall be credited to the Department for the enforcement of the act. No appropriation has been made and no funds may be credited to the Department for the enforcement of the narcotic law, Chapter 186, nor the ice cream law, Chapter 271. Any monies used for the enforcement of these acts must be taken from the regular appropriations of the Department which have already been again reduced this year as above indicated.

The appropriation for printing was increased sufficiently to allow the Department to resume the printing of the 'Public Health News." "The News" will, therefore, doubtless be issued during the coming year.

All requests for new employees, temporary or permanent, were refused, and, as has been the case for a number of years, no salary increases were allowed. A law was again passed at the last session of the Legislature providing that salaries of employees shall be continued to be reduced from one to ten per cent. during the coming year as in the past year.

A financial statement showing the expenditures by the Bureaus of this Department for the year ending June 30, 1933, will be found at the close of the report of this Bureau.

The question of securing Federal funds for necessary construction work in relation to water purification and sewage disposal plants in the State was discussed at a meeting of the Department held on May 2, 1933, at which time the following preamble and resolution were adopted :

WHEREAS, It is understood that the present administration advocates the expenditure of a considerable amount of money on public work in order to relieve unemployment; and

WHEREAS, The construction of necessary water purification and sewage disposal plants which are urgently needed in the State of New Jersey in order to protect the health and welfare of our citizens and to protect the interests of a large number of people deriving a livelihood from the gathering of shell-fish has been deferred because the municipalities are not able to raise funds to finance improvements; therefore,

Be it Resolved, That we bring to the attention of the President of the United States and the members of the United States Senate and House of Representatives from the State of New Jersey the desirability of aiding these municipalities in the construction of water treatment plants and sewage disposal plants in cases where the municipalities are at this time unable to finance these improvements; and,

Be it Further Resolved, That the Director prepare a list of such needed projects and request our United States Senators and Congressmen to use their best efforts to secure a part of this money for the purpose of protecting public health in the State of New Jersey.

A list of needed projects was prepared in accordance with the above resolution and submitted to the Federal authorities. It is hoped that funds will be secured for the construction of the plants referred to.

BOARD OF EXAMINERS AND EXAMINATIONS

Regular examinations were held on the last Friday of July, October, January and April during the past year as usual. No special examinations were conducted.

Edwin H. Coward, M. D., of Pleasantville, Patrick J. Monaghan of Newark, James J. Hagan of Jersey City, and David D. Chandler of Newark, together with Wallace T. Eakins and A. I. Goehrig of the Department, were re-appointed as members

of the Board of Examiners for the year beginning March 1, 1933. Mr. David D. Chandler was elected President and Mr. A. I. Goehrig, Secretary. Following the death of Mr. Goehrig in April last, Mr. Eakins was elected Secretary.

One hundred thirty-nine applications were filed with the Board of Examiners during the year for examination as Health Officer or Inspector.

Those securing a general average of seventy per cent or more were granted licenses as follows: Health Officer, 20; Sanitary Inspector of the First Class, 13; Sanitary Inspector of the Second Class, 1; Sanitary Inspector of the Third Class, 1; Plumbing Inspector, 20; Milk Inspector, 1; Veterinary Meat Inspector, 1.

The Bureau of Engineering of the Department conducted the usual examinations during the year for sewage and water plant operators. Information concerning said examinations will be found in Report of the Bureau of Engineering.

Animal Experimentation

Application was presented to the Department by Merck and Company, Inc., Rahway, for permission to conduct certain experiments on animals including cats and dogs in the laboratories of said Company at Rahway. A special committee of the Department was appointed to make investigation regarding said application, and this committee recommended that a permit be granted by the Department to Merck & Company as requested with the understanding that if the Company does not live up to its obligations, the Department may revoke the permit at any time, that any member or representative of the State Department of Health and any authorized member of the S. P. C. A. may enter the laboratory of the Company at any time, and, further, that the Company agrees never to experiment nor operate on any of the higher animals without anaesthesia, and that there shall be no torture.

In accordance with the recommendation of the committee, the following permit was issued to Merck & Company by the Department on January 10, 1933:

To all to whom these presents come, greeting:

The Merck and Company, Inc., Rahway, N. J., having presented to this Department a petition to carry on within the State of New Jersey scientific experiments or investigations as provided in Chapter 160 of the Laws of 1915, entitled: "An act for the prevention of cruelty to animals, approved March eleventh, one thousand eight hundred and eighty," wherein it is set forth that it is desired to conduct experiments on animals, including cats and dogs, such experiments to be conducted in the laboratory of the Merck Institute of Therapeutic Research, Rahway, New Jersey.

This is to certify that the Department of Health of the State of New Jersey, by virtue of the power conferred upon it by Chapter 160 of the Laws of 1915, aforesaid, hereby authorizes the said Merck and Company, Inc., to carry on scientific demonstrations, experiments and investigations, as above indicated, in the laboratory of the Merck Institute of Therapeutic Research at Rahway, in the county of Union and State of New Jersey.

Dated: Trenton, N. J.
This tenth day of January, 1933.

Cemeteries and Crematoriums

Application was made by citizen freeholders of North Brunswick Township, Middlesex County, for reversal of the decision of the Township Committee of said Township in granting consent to Mr. Herman Woltman to establish a cemetery on his farm in North Brunswick Township. A public hearing regarding said application was held by a special committee of the Department at the Adams School in North Brunswick Township on September 30, 1932. At the time of said hearing, statements were made to the effect that there were at that time already five cemeteries in said Township. A list giving the names and locations of the cemeteries was later submitted to the Department, and attention was called to the provisions of Chapter 20 of the Laws of 1929 regulating the number of cemeteries which may be located in any city, town or township in New Jersey. Evidence submitted showed that there were five or more cemeteries in North Brunswick Township, but there was some uncertainty as to how many of these were incorporated cemeteries. The Attorney General was, therefore, requested to advise the Department regarding Chapter 20 of the Laws of 1929, and the following opinion was received from him under date of October 11, 1932:

"October 11, 1932.

Dr. J. Lynn Mahaffey, Director,
Department of Health,
State House, Trenton, N. J.

DEAR SIR:

Your letter of October 7th regarding Chapter 20, Laws of 1929, is at hand. You request my opinion as to whether the act prohibits the location of an additional cemetery in a city, town or township if there are already five cemeteries in said municipality, or does it only prohibit the establishment of an additional cemetery in the case of a municipality in which there are already five incorporated cemeteries.

Section two of the act mentioned above provides in part as follows:

> 'No more than five cemeteries shall be located or placed under and by virtue of said act to which this is a supplement, in any one city, township, borough or town in any county of this State; *provided, however,* that nothing in this section shall prevent any cemetery association now incorporated from continuing, maintaining, enlarging and conducting any cemetery in any township of this State where such cemetery has been located and used for the past ten years successively * * *.'

My opinion is that this act prohibits the location of any additional cemetery if there are five already located in the municipality concerned. The fact that the cemetery is incorporated or unincorporated would not alter my view as the act specifically says that not more than five shall be located in any city, town, etc., of this State.

Yours very truly,

(Signed) W. A. STEVENS,
Attorney General."

Application was filed with the Department by Meyer A. Reubin, Esq., of New Brunswick on behalf of the New Brunswick Memorial Park Association for reversal of the decision of the board of health of Franklin Township, Somerset County, in refusing to grant consent to said Association to establish a cemetery in said Township on the Canal Road continuing on Easton Avenue just beyond the lands of the city of New Brunswick. Following the receipt of said application, a list was filed with the Department by the board of health of Franklin Township giving names and locations of eight cemeteries already located in the township, at least five of which are incorporated cemeteries. In view of said facts and of the above opinion of the Attorney General rendered on October 11, 1932, Mr. Reubin was informed

that the Department had no jurisdiction to consider the appeal in this case.

Application was made by Mr. Arthur S. Hough for a permit or license to install the proper equipment and engage in the business of cremation of dead human bodies in accordance with the provisions of Chapter 285 of the Laws of 1911, said crematorium to be located in a building to be constructed in connection with the dwelling now occupied by Mr. Hough at Ewing Cemetery near Trenton. A map of the premises filed by Mr. Hough showed that there was another dwelling located within 250 feet of the proposed crematorium, and a second dwelling located 600 feet from the said crematorium. The Attorney General was requested to advise the Department regarding Section 1 of Chapter 285 of the Laws of 1911, regulating the location of crematoriums, which provides that "no such license or permit shall be given to any person, firm or corporation to engage in or carry on any such business in any dwelling adjacent to or in the immediate vicinity of buildings used as dwellings." The Attorney General advised the Department that in his opinion the prohibition regarding the location of crematoriums adjacent to dwellings would apply in this case and that the Department would not be justified in granting a license to Mr. Hough.

Mr. Hough, therefore, had a bill introduced in the Legislature, Assembly Bill No. 176, which bill became a law, Chapter 84 of the Laws of 1933. This law gives discretion to the Department in the matter of granting a permit for the cremation of dead human bodies in a building adjacent to dwellings. In view of said new law, the matter was investigated by a special committee of the Department, and a permit was later issued to Mr. Hough to construct a crematorium in the basement of a building to be built in connection with his dwelling at Ewing.

Hospitals and Sanatoriums

A special committee of the Department conducted a hearing at Browns Mills, New Jersey, on June 23, 1932, regarding the applications of Mrs. F. Louise Leonard and Mr. Hilding A. Erickson for permission to establish tuberculosis nursing homes at Browns

Mills. Report was made by said special committee to the Department at its meeting on July 12, 1932, and it was on motion voted that permits be granted to Mrs. Leonard and Mr. Erickson to establish tuberculosis nursing homes in Browns Mills with the understanding that suitable fire escapes will be placed on said homes to prevent any hazard from fire.

Application was submitted by Mrs. Nancy F. Felton for permission to establish a hospital or sanatorium for cases of pulmonary tuberculosis in the Pig'n Whistle Inn at Browns Mills. A special committee of the Department held a hearing at Browns Mills on February 1, 1933, regarding said application, and at the meeting of the Department on February 7, 1933, it was on motion voted that a permit be granted to Mrs. Felton to establish a tuberculosis hospital or sanatorium as requested, subject to compliance with any recommendation of the Bureau of Engineering of the Department regarding the matter of the disposal of sewage from said building, and with the understanding that the State Department of Institutions and Agencies has approved of the building as to the hazard from fire.

Mr. Samuel Serman, Jr., of Old Bridge, presented application for permission to establish a convalescent home known as the "Health Home" for the care of arrested tuberculosis cases at 375-377 Ocean Avenue, Lakewood. A special committee of the Department was appointed to hold a hearing regarding said application, but Mr. Serman later withdrew this application and submitted another for permission to establish a tuberculosis home at a place known as "River Rest" located near Bound Brook, New Jersey. A hearing regarding the application was conducted by a special committee of the Department on the premises in question on June 2, 1933, and at the meeting of the Department on June 6, 1933, permission was granted to Mr. Serman to establish a tuberculosis home in the house known as "River Rest" located in Piscataway Township, Middlesex County, near Bound Brook, New Jersey, subject to the proviso that proper medical and nursing service for the patients be furnished, that necessary bath room facilities be provided, and that the regulations of the State Department of Institutions and Agencies in reference to the erection of fire escapes and other construction in the building be complied with.

An application was received from Mr. J. Havard Lloyd of Philadelphia for permission to establish a tuberculosis home at Pinewald near Toms River, Ocean County, New Jersey. May 25, 1933, was fixed as the time for a hearing on said application by a special committee of the Department at Pinewald, but Mr. Lloyd failed to appear at said hearing to present his application, and, therefore, no hearing was held and the application was declared void.

Annual Conferences

On February 10, 1933, the Twenty-third Annual Conference of State and Local Health Officials, called by the Director of Health, was held in the State House, Trenton, with sessions afternoon and evening. The conference proved very interesting and was apparently successful in every way, but due, doubtless largely to financial conditions, the attendance was much less than at the 1931 and 1932 conferences, there being about two hundred present. There were two hundred seventy present at the 1931 conference and three hundred six at the 1932 conference.

The conference was called to order by the Director of Health, J. Lynn Mahaffey, M. D., who extended a hearty welcome to the various representatives of local boards of health present.

The first paper at the afternoon session on the subject of "Proposed Legislation Dealing with Swimming Pools," was read by H. P. Croft, C. E., Chief of the Bureau of Engineering of the State Department of Health. The discussion on the subject was opened by Chester G. Wigley, Consulting Engineer, Atlantic City, formerly Chief of the Bureau of Engineering of the Department. Mr. Croft submitted a proposed bill for introduction at the 1933 session of the Legislature, and there was considerable discussion of the same, several of the Health Officers objecting to the bill because of the fact that it did not provide that authority be given to local health officials to regulate swimming pools as well as the State Department of Health.

Following the conference, the bill was amended to meet the objections of the local health officers regarding the point above mentioned as well as other features, but the bill was held up in committee in the Legislature and failed to pass.

Mr. Willaim H. MacDonald, Acting Chief of the Bureau of Local Health Administration, read a paper on the problem, "How Shall We Promote Diphtheria Immunization of Preschool Children." The discussion on this paper, offering "A Health Department's Solution," was opened by Mr. Frank J. Osborne, former Chairman of the New Jersey Committee for the Prevention of Diphtheria, Health Officer of East Orange. In further discussion of the paper, Samuel C. Haven, M. D., of Morristown offered "A Physician's Solution."

After the usual roll call of delegates by counties, a playlet featuring, first, the office of a District Health Officer, and second, a roadside stand, was presented.

The evening session was opened with moving pictures showing public health activities, after which Mr. Frederick L. Ferris, Editorial Writer of the Trenton Times, Trenton, read a paper on "Health Publicity and the Press."

"The Report of the Committee on the Cost of Medical Care and its Bearing on the Organization of Public Health Work," was presented by Haven Emerson, M. D., Professor of Public Health Practice and Executive Officer of the Delamar Institute of Public Health, Columbia University, New York City.

The Annual Meeting of the Health Officers' Association was held in the State House the next morning, February 11, 1933. At this meeting, in addition to the business session, the address of the retiring President, Mr. L. Van D. Chandler, Health Officer of Hackensack, was given, and the following named officers were elected for the coming year:

President, A. L. Stone, M. D., Camden; Vice-President, Dennis J. Sullivan, Jersey City; Secretary, William C. Blake, Princeton; Treasurer, N. J. R. Chandler, Plainfield; Members of the Executive Committee, W. W. Brooke, M. D., Bayonne; William H. MacDonald, Trenton; Amos Field, Jr., Kearny; R. C. Errickson, Long Branch; Edwin F. Stewart, M. D., Fair Haven; Budd H. Obert, Asbury Park; George N. Golding, Verona. Dr. Brooke was later chosen Chairman of the Committee.

The Fifty-eighth Annual Meeting of the New Jersey Health and Sanitary Association was held on December 9th and 10th, 1932, in the Monterey Hotel, Asbury Park, New Jersey. The

papers, addresses and discussions at the meeting proved very interesting, including a series of papers on the subject of "Experiences with Irradiated Milk and Milk from Cows Fed Irradiated Yeast," "Antirachitic Activation of Cow's Milk," "Soft Curd Milk—It's Production and Clinical Value," and "Special Milks—Health Department Administrative Problems," presented by experts in this line of work, together with papers on "Modern Laboratory Procedures and Products in the Control and Prevention of Communicable Diseases" with special reference to poliomyelitis experience and rabies in New Jersey, and "The Practical Application of Laboratory Knowledge in the Control and Prevention of Communicable Diseases."

On Saturday morning, December 10th, following the usual practice, a meeting of the Health Officers' Association of New Jersey was held in the hotel preceding the final business session of the New Jersey Health and Sanitary Association. At this meeting a very interesting paper on "Some Practical Problems in the Control of Syphilis" was read by Walter Clarke, M. D., Medical Director, American Social Hygiene Association, New York City.

Mr. Frank J. Osborne, Health Officer of East Orange, was elected President of the New Jersey Health and Sanitary Association for the coming year.

Legislation

The following Bills of interest to health officials were introduced at the last session of the Legislature:

Senate Bill No. 21, providing for the marking of milk and cream used in New Jersey, showing place and date of production. This bill failed to pass.

Senate Bill No. 95, creating Interstate Sanitation Commission with New York State and Connecticut. This bill failed to pass.

Senate Bill No. 96, naming commissioners to represent New Jersey on Interstate Sanitation Commission and providing tri-State compact respecting pollution of New York Harbor and adjacent waters. This bill failed to pass.

Senate Bill No. 133, repealing act permitting killing of trespassing dogs. This bill failed to pass.

Senate Bill No. 146, providing legal grades for eggs sold in New Jersey. This bill failed to pass.

Senate Bill No. 147, allowing licensing of farmers selling at public markets and fixing fee at $1.00. This bill became a law, Chapter 77.

Senate Bill No. 177, prohibiting the sale of milk and cream after July 1, 1933, unless produced from cows having had tuberculin test. This bill passed both Houses of the Legislature.

Senate Bill No. 186, making issuance of fraudulent marriage certificate a misdemeanor. This bill failed to pass.

Senate Bill No. 188, authorizing counties and municipalities to construct and operate sewage disposal plants under conditions laid down by Reconstruction Finance Corporation. This bill became a law, Chapter 364.

Senate Bill No. 203, placing milk and milk products under jurisdiction of Public Utility Commission. This bill was withdrawn.

Senate Bill No. 204, including milk producing and distributing companies within definition of public utility. This bill failed to pass.

Senate Bill No. 206, permitting State Department of Health to enforce a plumbing code. This bill failed to pass.

Senate Bill No. 229, requiring license for handling narcotic drugs. The bill became a law, Chapter 186.

Senate Bill No. 270, allowing issuance of emergency permits for milk shipments to make sufficient supply available for municipalities and specifying fee. This bill failed to pass.

Senate Bill No. 282, requiring marking of containers of incubated eggs for sale. This bill failed to pass.

Senate Bill No. 290, providing that birth certificates under act for legitimation of children shall not reveal births out of wedlock. This bill became a law, Chapter 188.

Senate Bill No. 305, appropriating $50,000 to the State Department of Agriculture to indemnify owners of cattle reacting to tuberculin test. This bill became a law, Chapter 133.

Senate Bill No. 309, requiring licenses to be obtained from State Department of Health by shippers sending milk into New Jersey. This bill became a law, Chapter 243.

Senate Bill No. 317, repealing Chapter 261, Laws of 1917, relating to pasteurizing by-products of creameries. This bill failed to pass.

Senate Bill No. 327, providing for licensing dealers buying and selling New Jersey milk and cream. This bill failed to pass.

Senate Bill No. 340, setting up new standards for Grade A milk and cream to be effective after July 1, 1933. This bill failed to pass.

Senate Bill No. 351, governing compounding of medical prescriptions to prevent adulteration. This bill became a law, Chapter 309.

Senate Bill No. 420, amending Milk Control Board act by striking from measure the words "within the State." This bill became a law, Chapter 255.

Assembly Bill No. 85, forbidding manufacture, sale or possession of offensive smelling bombs. This bill became a law, Chapter 94.

Assembly Bill No. 86, forbidding breaking or exploding of offensive smelling bombs with malicious intent. This bill became a law, Chapter 89.

Assembly Bill No. 110, directing Labor Department to license barbers and regulating barber trade. This bill was amended after introduction to provide that barbers shall be licensed and the barber trade regulated by the State Department of Health. This bill became a law, Chapter 175.

Assembly Bill No. 120, authorizing local boards of health to compel examination of persons reported by State to have venereal diseases. This bill became a law, Chapter 261.

Assembly Bill No. 121, providing for admission to municipal and county hospitals of persons suffering from communicable diseases. This bill failed to pass.

Assembly Bill No. 144, providing tuberculosis examinations for prospective public school teachers. This bill failed to pass.

Assembly Bill No. 145, providing more thorough physical examination for school pupils. This bill failed to pass.

Assembly Bill No. 146, providing physical examinations for teachers in discretion of Boards of Education. This bill failed to pass.

Assembly Bill No. 149, requiring Hackensack Valley Sewer Commissioners to turn over records to the Hackensack River Sewerage Commission when latter is created. This bill failed to pass.

Assembly Bill No. 150, creating Hackensack River Sewerage Commission and defining jurisdiction. This bill became a law, Chapter 288.

Assembly Bill No. 167, providing for licensing of swimming pools by the State Department of Health. This bill failed to pass.

Assembly Bill No. 176, giving State Department of Health greater discretion in granting permits relating to the cremation of dead human bodies. This bill became a law, Chapter 84.

Assembly Bill No. 177, providing that copies of local vital statistics records dated prior to January 1, 1849, shall be filed in the State Bureau of Vital Statistics. This bill failed to pass.

Assembly Bill No. 210, extending anti-pollution protection to that section of the Passaic River between Little Falls and Great Falls. This bill failed to pass.

Assembly Bill No. 214, allowing extension of school health service to pre-school children. This bill failed to pass.

Assembly Bill No. 238, requiring Chancery Court to grant extension of time to municipality ordered to construct sewage disposal plant if municipality is financially unable to carry out order. This bill became a law, Chapter 50.

Assembly Bill No. 289, prohibiting sale of barbital or any other hypnotic drug except in certain cases. This bill was withdrawn.

Assembly Bill No. 291, regulating manufacture and sale of carbonated beverages. This bill failed to pass.

Assembly Bill No. 308, making owner of dog liable for damages if animal bites person while victim is in a public place or lawfully in a private place. This bill failed to pass.

Assembly Bill No. 317, providing for sterilization of inmates of certain institutions. This bill failed to pass.

Assembly Bill No. 327, regulating practice of naturopathy. This bill failed to pass.

Assembly Bill No. 363, providing for the manufacture and sale of milk caps by the State Department of Health and prohibiting the sale of milk unless capped as specified. This bill failed to pass.

Assembly Bill No. 364, specifying maximum bacteria content for milk and allowing pasteurization only once. This bill failed to pass.

Assembly Bill No. 368, forbidding the sale of adulterated ice cream products. This bill became a law, Chapter 271.

Assembly Bill No. 369, adding ice cream containers to the list upon which proprietary designations are permitted. This bill passed both Houses of the Legislature.

Assembly Bill No. 374, regulating sale of barbital and other hypnotic drugs. This bill became a law, Chapter 279.

Assembly Bill No. 383, regulating planting of foreign oysters and other shellfish in New Jersey waters. This bill became a law, Chapter 345.

Assembly Bill No. 392, compelling reports on tuberculosis sanatorium patients to be made direct to State Health Department. This bill failed to pass.

Assembly Bill No. 402, providing for segregation of persons suspected by county health officers of having contagious diseases. This bill failed to pass.

Assembly Bill No. 420, providing that at least one member of the State Department of Health shall be actively engaged in the business of oyster planting. This bill failed to pass.

Assembly Bill No. 448, regulating the embalming and burial of bodies brought into New Jersey from without the State. This bill failed to pass.

Assembly Bill No. 469, creating a State Milk Control Board. This bill became a law, Chapter 169.

Assembly Bill No. 491, regulating the sale of eggs. This bill failed to pass.

Assembly Bill No. 506, permitting municipalities to condemn land for hospitals. This bill became a law, Chapter 356.

Assembly Bill No. 525, requiring licensing of persons gathering clams and oysters. This bill failed to pass.

Assembly Bill No. 537, providing that expenses under act to regulate barbering be defrayed from funds received pursuant to the act. This bill became a law, Chapter 359.

Report of the Bureau of Local Health Administration

For the Year Ending June 30, 1933

WILLIAM H. MACDONALD, ACTING CHIEF

Investigation of outbreaks of communicable diseases, recording of data pertaining to the prevalence of these diseases and the application of measures designed to prevent their occurrence and spread constitute the basic activities of this Bureau.

During the calendar year of 1932 there were received from the 563 local boards of health in New Jersey, reports of 66,610 cases of the 32 diseases declared reportable in Chapter VI of the State Sanitary Code. This is slightly below the total number of cases of these diseases reported in the preceding year.

Although it is expected the annual prevalence of any communicable disease will fluctuate to some degree, New Jersey for several years past has experienced a decline in the rate of occurrence of both typhoid fever and diphtheria. This decline continued in 1932. The reduction in the case rate of typhoid fever for the year was slight; however, both the annual case and death rates from this disease reached the new low levels of 6.37 and .68 per 100,000, respectively. In diphtheria, although the reduction was not as marked as in the preceding year, the case and death rates for 1932 (33.12 and 2.29 per 100,000) were new low records.

It is encouraging to note that the diphtheria rates for 1932 are only about one-fifth as high as the corresponding rates of five years ago. There can be no question that the marked reduction in diphtheria in New Jersey during the past decade is chiefly due to the extensive use of toxin-antitoxin and toxoid. However, one thousand four hundred and three cases of diphtheria, causing ninety-seven deaths, occurred in the State last year, over fifty per

cent. of the deaths being among children less than five years old. Therefore, the use of toxin-antitoxin and toxoid should continue if the advantage gained in diphtheria prevention is to be enhanced or even retained and in order to secure the greatest value in further preventing sickness and death from this disease, the use of these immunizing agents should be particularly stressed among children below five years old.

Scarlet fever, although comparable to diphtheria in many respects, has not been attacked from the standpoint of widespread immunizations, and the prevalence of this disease, judging from case reports, has been reduced only a very little during the past decade. The death rate from this disease, however, has lowered.

Measles and whooping cough continue to exact their toll, particularly among young children. Seventy-eight per cent. of the deaths from measles and ninety-six per cent. of deaths from whooping cough in 1932 were in children less than five years of age. Of the 32 diseases declared reportable by the State Sanitary Code, whooping cough last year stood third as a cause of death. It was exceeded by pneumonia and tuberculosis.

The 1932 death rate from tuberculosis of all forms reached a new low record of 60.65 per 100,000. The number of new cases of tuberculosis reported was also less than in previous years.

Tables giving detailed data about the distribution and prevalence of the reportable diseases for the calendar year 1932, as contained in official reports, are given later in this report.

Rabies in Animals—While rabies in animals has been reportable to local boards of health by law since 1915, no system had been in effect whereby reports of these cases reached the State Department of Health nor any other central agency. In April, 1932, the State Department of Health passed a resolution in accordance with authority granted it by law, calling upon local boards of health to report weekly each case of rabies in an animal of which such board had knowledge. Forms were furnished local boards of health for use in forwarding such reports. From the date of this resolution to December 31, 1932, reports were received of 222 cases of rabies in animals. Over eighty per cent. of these cases were reported by boards of health in the counties of Essex, Bergen, Passaic, Union and Middlesex.

Number of Cases of Rabies in Animals reported by Local Boards of Health, by Counties and by months, April-December, 1932.

Total	7	54	46	26	21	16	19	18	15	222

By these rabid animals many persons were bitten and as a preventive of rabies, underwent the inconvenience and bore the expense of taking Pasteur treatments. Three fatal cases of rabies in humans were reported during the year. Each of these fatal cases was in a male, one 6 years of age, one 11 and one 13 years old. None of these persons received anti-rabic injections after having been bitten by a rabid animal.

The provisions of Chapter 66, Laws of 1930, require that physicians and others report to local boards of health the names and addresses of persons bitten by dogs irrespective of whether the animals are suspected to have rabies. Seven thousand, eight hundred and nine such cases were reported to local boards of health during 1932.

Investigation of Outbreaks—Detailed investigation to determine the probable source of infection of cases of communicable diseases is one of the most important factors in any program designed to

prevent the spread of these diseases. While such investigations are made as a routine in communities having progressive health departments, in a great number of the smaller communities such investigations either are incomplete or are entirely neglected. In order to partly make up this deficiency, employees in the Bureau, in addition to the investigation of extensive local outbreaks, also make investigation when practical of scattered cases of certain communicable diseases. During the fiscal year ending June 30, 1933, employees in the Bureau investigated in the field 355 such cases in 145 municipalities.

Typhoid Fever—Sixty-six cases of typhoid fever in 46 municipalities were investigated. All these cases were scattered except a group of eight centering in a village in Bedminster Township, Somerset County. Five of these eight cases were judged to have resulted from infection received from earlier cases in these families before the true character of the illness was recognized. No definite source of infection for the earlier cases was proven; however, it was found by inspection and by analysis the well from which water was regularly used by these persons was polluted.

Gastro Enteritis caused by Ice Cream—An extensive outbreak of gastro enteritis caused by eating contaminated coffee ice cream occurred in nine municipalities in the northeastern part of the State early in April. Known cases numbered 78.

Investigation brought to light facts which indicated that a small quantity of custard which had been improperly stored and then accidentally added to one freezer of a large batch of coffee ice cream had been the cause of the outbreak. Portions of this lot, when tested in the laboratory of the Department, contained from 300,000,000 to over a billion bacteria per cubic centimeter. Organisms present included staphylococci, streptococci and bacilli. Some of these were capable of producing toxic products.

The manufacturer of the ice cream removed unsold portions of the batch from dealers cabinets promptly, thus preventing the use of much of it.

The occurrence of these cases of illness proves once more that great care should be exercised by manufacturers of foods to which custards are added to prepare this product in a clean manner, cool it promptly and keep it cold until consumed.

Gastro enteritis attributed to Raw Milk—An outbreak of gastro enteritis which occurred at Blair Academy in September was attributed to the use of raw milk used at the school at that time. Medical attention was required in 32 cases and it was found during the investigation that some 80 persons at the school had been affected with acute diarrhea, with or without other indications of illness.

The fact that two of the cases occurred in families of employees of the Academy who used the same milk but no other food in common with the school was an added check on the accuracy of the epidemiological evidence pointing to milk as the vector of infection. The original source of contamination of the milk was not proved.

Acute Anterior Poliomyelitis—This disease again assumed a mildly epidemic form in the State during the summer and fall of 1932, in spite of the fact that the outbreak in 1931 was the largest since the widespread epidemic of 1916. In 1931, the cases which occurred in the northern part of the State far exceeded the number reported from the southern section; in 1932, on the other hand, the southern counties, into which there is greater movement of population from Philadelphia and the nearby metropolitan section in New Jersey, were chiefly affected. A slight increase in the number of reported cases of this disease was noted in July but the definite increase above normal occurred during the first week in August. The peak in the number of case reports received weekly was reached on the seventh week following, after which the prevalence of the disease gradually dropped to normal. During the period from July 1st to December 31st, three hundred and thirty-nine cases and thirty-eight deaths were recorded. The indicated fatality rate based on these records was 11.21. One hundred and thirteen of the reported cases were in persons less than five years old, one hundred and twenty-one patients were from 5-9 years of age, eighty-six from 10-19 years and nineteen were over 20 years of age. The number of reported cases among males was more than 22 per cent. greater than the number among females.

Following the policy established in 1931, anti-poliomyelitis convalescent serum was made available to physicians at local distributing stations for use in treating persons affected with the disease. A call for donors of blood was made, valuable co-operation in this again being rendered by the New Jersey Crippled Children's Commission. Blood collecting clinics were held in Camden and Atlantic City at which about 15,000 cubic centimeters of blood were given by 38 persons who had recovered from poliomyelitis. The E. R. Squibb and Sons Laboratory again generously volunteered to prepare serum from this blood.

At the time the call for donors was made no money was available to pay for blood and no person who gave blood did so with the understanding that payment would be received. Later, however, an emergency appropriation made it possible to offer each person who had given blood the sum of $10.00.

Some convalescent serum remaining from the supply collected during 1931 was released to be administered by physicians as a possible preventive to children in contact with cases of infantile paralysis. Information collected is not sufficient to warrant a definite conclusion as to whether the material used was effective as a preventive.

Trachoma—The outbreak of trachoma early in 1932 resulted in problems of controlling this disease which carried over into the past fiscal year. In addition, the recurrence of signs in many treated cases at the orphanage from which the disease spread indicated that the infection was not under control.

When this became evident, arrangements were made for the re-examination of all children reported as having trachoma in 1932 and of home and school contacts of any new or recurrent cases discovered. As a result, it was found that 18 cases were still under treatment, 17 cases which were thought to be cured had again shown signs of the disease and 21 new cases had developed among contacts of those previously affected.

Treatment and operation if necessary were made available for all known cases. In this the orphanage authorities, State Board of Children's Guardians, various ophthalmologists and hospital clinics and numerous local boards of health joined to furnish proper care for the affected children, many of whom were indigent.

Trichinosis—The occurrence of 52 reported cases of trichinosis in the State during the year indicates that many persons do not heed the oft-repeated warning to cook thoroughly all pork and pork products. The largest outbreak of this disease occurred in Atlantic City in February, where 20 acute cases followed the eating of raw, or slightly cooked, home-made Italian sausage made from pork raised and slaughtered on a nearby farm.

Smaller outbreaks, each including from one to seven cases were reported from 10 other municipalities among persons who had eaten undercooked pork. In Paterson, three such outbreaks developed in July and December of 1932 and in May of 1933, including 13 cases in all.

Undulant Fever—During 1932, 36 cases of undulant fever were reported. Investigation was made of most of these cases either by employees in the Bureau or through local boards of health. The data collected in such investigations show that three of the patients evidently received infection outside of New Jersey and two others probably became infected out of the State. History of the kind of milk used prior to onset was obtained in 27 of the remaining cases. Twenty-one of these gave a history of using raw milk, 19 regularly and 2 occasionally. Five stated they had used only pasteurized milk and in one instance the use of any milk by the patient was denied.

Tularemia—Three cases of tularemia were reported during the calendar year. One was in a resident of Salem County who gave a history of cleaning a rabbit shot locally and who probably received infection from this animal. Another occurred in a resident of Cape May County in a person handling a rabbit killed in that county. The third case, a Union County resident, cleaned a rabbit obtained from a public market a few days prior to the onset of illness. This rabbit was found to have been part of a shipment from Illinois, and originated from a section of that State in which cases of tularemia were not uncommon.

During the latter part of the fiscal year another case of tularemia occurred in Bergen County in a person who shortly prior to illness dressed a rabbit which was part of a shipment from another point in the State of Illinois.

Malaria—During the calendar year there were reported but six cases of malaria in New Jersey. Four of these cases were reported from Monmouth County, one from Essex and one from Hudson. By investigation it was clearly established that at least five of these cases received infection outside New Jersey.

Rocky Mountain Fever—A case of rocky mountain spotted fever occurred during the summer of 1932 in a resident of Millville, Cumberland County, who evidently was infected locally.

Communicable Diseases on Dairies—Forty-seven dairy premises on which occurred fifty-three cases of certain communicable diseases, the infection of which may be transmitted through milk, were visited during the year by employees in the Bureau. From two of these dairies the sale of milk was prohibited temporarily by order from the State Department of Health and in one instance the sale of milk was discontinued voluntarily by the producer. In a few other instances milk from the premises on which the disease occurred was not accepted by the distributor during the continuance of the case thereon.

Assistance in Diagnosis—Although it is not the general practice in the Bureau to furnish assistance in the diagnosis of suspected cases of communicable diseases, except under unusual conditions, requests for such aid were complied with in 80 instances during the year. The diseases suspected included smallpox and chickenpox, typhoid and scarlet fever, typhus fever, diphtheria, poliomyelitis, trachoma, septic sore throat and rocky mountain spotted fever.

Typhoid Carriers—During the year there were added three carriers of typhoid bacilli to the list of such persons on file at this office. One of the carriers formerly listed died during the year. The place of residence and the present occupation of all carriers listed were checked during the year either by employees in the Bureau personally or through local health departments.

Diphtheria Immunization—No organized campaign was carried on by the Bureau during the year to urge the establishment of diphtheria immunization clinics. In the educational work which

was performed emphasis was chiefly placed upon the desirability of having children receive immunization rather than upon the establishment of clinics for this purpose. At the request of local communities, however, employees in the Bureau assisted in giving immunization treatments to 1,352 children in seventeen municipalities or institutions, and assisted in giving Schick tests to 2,362 children in twenty-five municipalities.

Special Investigations—Requests were received during the year to a greater extent than usual from citizens and local officials for the investigation of conditions generally classed as nuisances. While many such conditions complained of are trivial in character, and do not properly come within the scope of health department work, many relate to conditions which are in reality potentially dangerous to the public health. In spite of the fact that local boards of health are granted power by law to secure the abatement of nuisances detrimental to the public health, a number of boards, particularly in the smaller communities, neglect or delay taking action to secure the abatment of such conditions unless stimulated so to do by the State Health Department or by some other agency. Over 400 special investigations were made by employees in the Bureau during the year, a number of these involving inspection of groups of premises to locate violations of regulations of Chapter I of the State Sanitary Code. The conditions investigated, in addition to alleged or actual violations of Chapter I of the Code, included garbage dumps, mosquito breeding areas, conditions resulting from the keeping of animals, odors resulting from industries, etc. Inspection was made of several proposed cemetery sites and several proposed sites for tuberculosis hospitals.

Conferences on Health Subjects—Conferences with local health officials and others interested in local health administration constitutes a very important part of the Bureau's activities. Approximately 2,000 conferences with local health officials were held during the year by the personnel of the Bureau. At these conferences there were discussed a great variety of matters pertaining to the organization of local health departments and problems confronting such departments in the employment of personnel, adoption and enforcement of ordinances, establishment of measures to prevent

the spread of communicable diseases, abatement of nuisances, enforcement of regulations of certain chapters of the State Sanitary Code as well as many unusual problems confronting such officials.

There were also held over 4,000 conferences with officials other than health department agents, with physicians and citizens on subjects pertaining to public health and the administration of this work through organized agencies. Fifty meetings of local boards of health were attended, and a still greater number of meetings of other organizations and bodies at which public health matters were principally discussed. Thirty-three papers or talks on matters relating to health department activities coming within the scope of the Bureau were delivered.

District Health Officers—The policy established by the Department in 1919 in assigning employees in the Bureau of Local Health Administration as district health officers to certain sections of the State, was continued during 1932 but with modifications. Owing to limited appropriations no clerk was retained in any of the five district offices, except in the Monmouth County area where clerical aid was furnished by the County Board of Freeholders. No office quarters for district officers were maintained from State funds during the year. However, office space for this purpose was furnished in the Monmouth County area, the Atlantic County section and in the Bergen County section in county buildings by the respective County Board of Freeholders. Each of the five district officers was permitted to use a State owned car, but their travel expenses and auto repair and maintenance charges were borne by these employees. No district officer was assigned to the northwestern district proposed to include the counties of Sussex, Warren and Morris. Experience during the year demonstrated that the effectiveness of the work of district officers is materially lessened when there is no one at the local headquarters to receive emergency telephone calls and other requests for assistance and advice while the district officer is engaged in field work.

Eating Establishments—The Department at its meeting on March 7th, directed the preparation of regulations dealing with

sanitation at roadside stands and other establishments where food or drink is offered for sale to the public, and which would contain more detailed standards applying to such establishments than are now set forth in law. Accordingly a list of standards of sanitation which in the opinion of the Department should be applied at all such establishments as a minimum was prepared and adopted. These minimum standards are based upon general provisions now set forth in public health laws and in regulations of the State Sanitary Code. Although the standards as adopted do not in themselves have the force and effect of law, they are so worded that action for their violation may be taken by local boards of health under existing statutes or under the State Sanitary Code.

A circular containing these minimum standards was prepared and distributed to local boards of health. By direction of the Department, district health officers render such services as is practical in the inspection of eating establishments in the areas to which they are assigned. The general policy followed in such areas is to urge upon local boards of health that inspection be made of all food vending establishments to determine whether compliance is being made with the minimum standards. At the same time the services of the district officer are offered to the local board of health to make such inspections in the municipality either alone or in company with some representative of the local board of health, if the local health department does not desire to make such inspections independently. Up to the date of this report employees in the Bureau have inspected over 200 eating establishments. Samples of water from supplies used at these places are collected if suspected of being contaminated. Violations of the State Sanitary Code are brought to the attention of the local board of health.

Summer Camps—In areas in which district health officers operate each summer camp is inspected at least once a year. In other sections of the State inspection is made of such camps when and if practical. Although by the provisions of Chapter X of the State Sanitary Code, it is anticipated that local boards of health in municipalities in which camps are established will make inspection therein, this provision has had but very little effect upon camp

sanitation. As a rule camps are established in townships in rural sections in which the local board of health does not employ a skilled health official who is willing to take the time to make such inspection. As a result the only inspections made at most camps by health officials are those made by the State Department of Health. While the majority of camp directors conscientiously endeavor to maintain a high standard of sanitation at the camps coming under their supervision, inspection of such camps rather frequently reveals conditions which have been overlooked or not sufficiently emphasized and which constitute a hazard to the health of campers.

Summer School for Health Officials—Eighteen students attended the summer courses in public health offered by Rutgers University and the State Department of Health in 1932. The eleven members of the advanced class completed the two-summer course in a satisfactory manner and received the Rutgers Certificate in Public Health.

Report of the Bureau of Engineering

For the Year Ending June 30, 1933

H. P. Croft, C. E., Chief

"Although there have been advances in all lines of medical science, in no one field of endeavor, perhaps, has there been such a saving of life as in the installation of water supply and sewage disposal plants." This is part of the statement issued by Dr. H. S. Cumming, Surgeon General, United States Public Health Service, under date of May 11, 1933, in his consideration of the appropriation of moneys for the relief of unemployment by the construction of public works. He also stated: "There can, however, be no question that if such appropriations be made available, in no way could they be more useful to this and future generations than in the construction and installation of adequate and safe water supplies and sewage disposal systems."

The effect of the economic conditions upon the sanitary engineering field of public health is reflected in the following table, which shows the value of the engineers' estimates on the plans for water and sewage projects submitted during the last five years to the bureau for examination:

Fiscal Year Of	*Water Projects*	*Sewage Projects*	*Total of Water and Sewage Projects*
1929	$1,577,751	$7,775,147	$9,352,898
1930	936,194	4,808,559	5,744,753
1931	1,384,064	6,249,622	7,633,686
1932	1,816,025	2,212,479	4,028,504
1933	427,596	887,655	1,315,251
Average of 5 year period	1,228,326	4,386,692	5,615,018

A barrier against the "saving of life" was erected by the passage of Chapter 50, P. L. 1933. This law is as follows:

"A Further Supplement to an act entitled 'An act respecting the Court of Chancery' (Revision of 1902), approved April third, one thousand nine hundred and two."

"BE IT ENACTED *by the Senate and General Assembly of the State of New Jersey:*

"1. Where any decree has been or shall be entered in the Court of Chancery to compel any municipality to install and maintain a sewage disposal plant, and it shall be represented to the court by said municipality that it is unable to meet its financial obligations and unable to borrow money for the purpose of installing and maintaining such sewage disposal plant, such municipality is hereby authorized and empowered to present a petition to said court reciting such facts and requesting an extension of time within which to comply with the terms of said decree and the court, after examining into the matter and being satisfied of the truthfulness of the facts set forth in said petition, shall grant an extension of time to said municipality to commence the work of such installation and maintenance as the court shall deem just and proper.

"2. This act shall take effect immediately.

"Approved March 13, 1933."

The heavy financial burdens carried by the inhabitants of the State in the year of 1932 and the winter of 1933 were, no doubt, justification for the establishment of this law. The passage of the federal act, which has for its purpose the industrial recovery of the nation, now warrants the repeal of Chapter 50, P. L. 1933. The construction of safe water supplies and satisfactory sewerage systems will result in improving the public health, preserving the natural resources and promoting the happiness and prosperity of the inhabitants of the State. The establishment of these water and sewage projects will also result in a decided economic improvement to the State—a work of lasting value when it is compared with certain other lines of work being done for the relief of the unemployed.

There are other factors to be considered in the situation produced by the establishment of Chapter 50, P. L. 1933. Many municipalities who have co-operated with this department and have assumed additional financial obligations for public health protection are now being penalized through the failure of neighboring municipalities to act. For this co-operation these municipalities have, in many cases, been attacked by their taxpayers. In

fairness to these indebted municipalities and their taxpayers, the chapter should be repealed.

In accordance with instructions from the Director of Health, there was prepared for his consideration under date of June 1, 1933, a program comprising the control of stream pollution and the construction of sewage treatment plants, with the basic principle in mind that stream pollution, sewage disposal, safe water supplies, recreational centers and shellfish areas are allied subjects. This program has for its purpose the encouragement of industrial recovery in New Jersey, under the terms of the "National Industrial Recovery Act," HR 5755, passed by Congress on June 13, 1933.

Pertinent data from tables and charts compiled for the aforementioned report show: that the program represents an expenditure, within a two year period, of approximately $28,000,000, and, the completion of the work begun under the program will represent an expenditure of over $37,000,000; that approximately 470,000 man hours of professional services will be required to execute the two year program; that approximately 20,000,000 man hours of skilled and unskilled labor will be required to perform the work; that approximately $8,400,000 will be expended on materials, and $5,600,000 on machinery and equipment and, that over $7,000,000 of this $14,000,000 will be expended on indirect labor during the two year period.

As in the former reports of the bureau, this report has for its purpose not only the recording, in summary, of the work done during the fiscal year, but also the establishment in permanent form,—

> Of the progress made in certain lines of endeavor started several years in the past; the listing of departmental actions together with acts introduced and permits issued, all of which are believed to be of value to sanitarians in general and local health officials in particular. It includes the revision of tables relating to water and sewage installations, which experience has demonstrated are of value not only to the aforementioned groups, but also to others, including: the layman, municipal officials, industrial interests and prospective settlers, permanent and transient, within the State.

The outline of the report that follows can be summarized as:

1. Number of water and sewage projects acted upon by the department with estimates of costs.

2. Transfer of the water and sewage laboratory to the Bureau of Chemistry.

3. Table of samples analyzed in the sewage and water laboratory from July 1 to July 31, 1932.

4. Public potable water supplies defined through a resolution adopted by the department December 6, 1932.

5. Pollution of the waters of the Raritan River and its tributaries.

6. Table upon work accomplished by the bureau during the year.

7. Creation of the Hackensack Valley Sewerage District.

8. Rules and regulations governing the issuance of licenses to operators of sewage treatment and water purification and/or treatment plants.

9. Water used upon interstate carriers.

10. Physical connections with public potable water supplies with table of connections between approved public supplies and unapproved private supplies.

11. Disposal of sewage from North Jersey seashore municipalities.

12. Bathing pools.

13. Stream sampling stations.

14. Establishment of factories on watersheds.

15. Table upon public potable water supplies.

16. Table upon municipal sewage treatment plants.

Into the preparation of the following entered those employees of the bureau who took leading parts in the detailed field investigations, the holding of examinations, the preparation of resolutions adopted and acts proposed for adoption.

I wish to commend to you, Mr. Director, the personal interest shown in, and the faithful performance of, the duties assigned to the personnel of the bureau. Their hearty co-operation resulted in producing, in my opinion, one of the outstanding years in the work of the Bureau of Engineering.

The following table No. 1 shows the number of water and sewage projects examined by the bureau for departmental action and includes the number of plans approved for such projects, the number of applying municipalities and the consulting engineers' estimates of cost of such work.

Water and Sewage Laboratory

The water and sewage laboratory, under the control of the Bureau of Engineering since July 15, 1927, was transferred to the Bureau of Chemistry on August 1, 1932.

The increasing number of public potable water supplies and sewage treatment plants and the increasing number of detailed surveys in the matter of surf and stream pollutions were, in the greater part, responsible for the increased appropriation authorizing the employment of additional engineers and watershed inspectors in the Bureau of Engineering in the latter part of the fiscal year 1932; and, to permit greater concentration in the above lines of work, it was believed that the department should give consideration to the lodging of the supervision of the water and sewage laboratory in the Bureau of Chemistry, especially in view of the proposed alterations for laboratory purposes. In the Chemistry Bureau is already lodged work of a similar character and such a transfer will, among other benefits, result, it is believed, in a more efficient utilization of the personnel of the two bureaus and provide more direct supervision by a Bureau Chief.

TABLE NO. 1—NUMBER OF WATER AND SEWAGE PROJECTS EXAMINED FROM JULY 1, 1932, TO JUNE 30, 1933

Character of Projects	*Number*	*Number of Plans*	*Number of Applying Municipalities, Commissions or Companies*	*Engineers' Estimates of Costs*
Sewage:				
Sewer extensions and pumping stations ..	16	37	11	$97,630.00
Trunk, sub-trunk, relief, intercepting and outfall sewers	3	10	3	31,500.00
Alterations and improvements at existing sewage treatment works	10	49	9	232,525.00
Sewer systems, new	1	28	1	30,000.00
Sewage treatment works, new	2	61	2	496,000.00
Water:				
New systems and supplies	10	18	10	89,700.00
Alterations, improvements and additions to water works	38	67	32	337,896.00
Totals	80	270	68	$1,315,251.00
Total of engineers' estimates of costs for the fiscal year ending June 30, 1932				$4,028,504.00

The following table No. 2 sets out the character and quantity of analyses and examinations made in the water and sewage laboratory from July 1 to July 31, 1932.

TABLE No. 2—SAMPLES ANALYZED IN WATER AND SEWAGE LABORATORY

Month	Public Water Supplies	Private Water Supplies						State Park and Forest Supplies	State Institution Supplies	County Institution Supplies	County Park Supplies	Bottled Water Supplies	Dairy Supplies	Bathing Waters	Stream Samples	Surf Samples	Sewage Samples	Trade Waste Samples	Sand Samples	Totals

* The water and sewage laboratory was transferred to the Bureau of Chemistry August 1, 1932.

Public Potable Water Supplies Defined

The following preamble and resolution was adopted at the Board meeting on January 10, 1933, defining a public potable water supply under the health regulations of the Department of Health of the State of New Jersey:

Whereas, The Department of Health of the State of New Jersey requested opinions under dates of April 23, 1929, and May 3, 1929, from the Attorney General of the said State relative to the jurisdiction of the Department of Health of the State of New Jersey over public potable water supplies and what constitutes such supplies under the provisions of Chapter 253 of the P. L. of 1909, being an act of the Legislature of New Jersey, entitled "A supplement to an act entitled 'An act to secure the purity of the public supplies of potable waters in this State,' approved March seventeenth, eighteen hundred and ninety-nine," approved April twenty-first, nineteen hundred and nine; and

Whereas, The said Attorney General under dates of April 25, 1929, and May 8, 1929, issued opinions to the Department of Health of the State of New Jersey upon the information requested in the aforementioned letters, setting out that the act deals not only with the sale of water, but also with distribution thereof; that the Department has no jurisdiction in the furnishing of water to hotels and other establishments delivering water to guests and others merely as an accommodation as such constitutes a private supply; that the act clearly prohibits the distribution or the sale of water which is polluted or which may become so, and that the word "public" as used in the act of 1899 and its amendments does not necessarily mean all of the public nor most of the public nor, indeed, many of them, but so many of them as contradistinguishes them from a few; and

Whereas, From time to time, since the receipt from the Attorney General of the aforementioned opinions, a number of individuals who are supplying water to a small number of properties have been required by the Department, where such supplies have been found upon investigation by representatives of the Department or reported to be supplying water to consumers to the Department, to adhere to the requirements of the statute; and

Whereas, Such supplies are becoming more numerous and the Department is of the opinion that a large number of such small water supplies exist throughout the State and requested the Attorney General under dates of September 21, 1932, and October 3, 1932, as to whether the Department should consider a supply distributing water to three or four premises as a private potable water supply or a public potable supply and one over which the Department should assume jurisdiction; and,

Whereas, The Attorney General under dates of October 1, 1932, and October 11, 1932, advised the Department that if the Department feels that four families would constitute the "public" intended to be protected by the provisions of the Potable Water Act, then the said Department would have jurisdiction over such supply; and

WHEREAS, In the aforementioned opinion of the Attorney General rendered to the Department under date of May 8, 1929, in which the Attorney General set out that "the word 'public' as used in the potable water act of 1899 and its amendments, does not necessarily mean all of the public nor, indeed, many of them, but so many of them as contradistinguishes them from a few;" and

WHEREAS, The word "few" is defined in the Bible, I Peter 3:20, as eight and has been legally defined as an indefinite expression for a small or a limited number, which number may include fifteen or twenty, as set out in some of the court decisions; but in cases where an exact description is required, the use of the word "few" will not answer; and,

WHEREAS, Under an opinion rendered in the case of the *Junction Water Company* vs. *Frank G. Riddle,* 109 N. J. Eq., p. 523, it is set out that an individual supplying several houses owned by him and occupied by tenants with water service through mains and conduits laid partly on his own land and partly in the public streets does not thereby become a public utility within the meaning of that term as used in Sec. 15, Chap. 195, P. L. 1911, p. 376, as amended Supp. C. S. 1925-1930, p. 1487, and the right to sell water is not a prerogative of government but a business in which any person may engage without legislative authority; and

WHEREAS, The Department of Health of the State of New Jersey approved as a source of public potable water supply the supply of the aforementioned Frank G. Riddle of Hampton, New Jersey, from which source of supply water is sold or delivered to eight dwellings besides his own premises; and,

WHEREAS, The Attorney General of this State advised under date of April 26, 1932, that the Department of Health of the State of New Jersey in carrying out the provisions of Chapter 253 of the P. L. of 1909 is not dealing with the question of whether an individual furnishing water is pursuing the functions of a public utility but solely whether or not an individual is furnishing water to the public or a portion thereof; and

WHEREAS, The Department of Health of the State of New Jersey, under the provisions of Chapter 253 of the P. L. of 1909, being an act entitled, "A supplement to an act entitled, 'An act to secure the purity of the public supplies of potable waters in this State,' approved March seventeenth, eighteen hundred and ninety-nine," approved April 21, 1909, in the approval of a source of water supply from which water is to be sold or distributed for potable purposes is dealing alone with the quality of the water supplied; and

WHEREAS, It is the opinion of the Department of Health of the State of New Jersey that an exact definition should be made of the number of dwellings and/or properties that are supplied with potable water so as to determine the supplies that should be classified as public potable water supplies in this State; therefore,

Be it Resolved, By the Department of Health of the State of New Jersey, at a meeting held on the sixth day of December, A. D. one thousand nine hundred and thirty-two, it is the opinion of the said Department of Health that,

in order for sources of water supplies to be considered as public potable supplies, they must represent sources of supply from which water is distributed or sold to consumers for potable purposes in eight or more dwellings and/or properties, and where water from sources of supplies is distributed or sold to less than said number of dwellings and/or properties such supplies will hereafter be considered as private sources of water supplies and which supplies come within the jurisdiction of local boards of health having control over the territory wherein such supplies are located.

The resolution does not apply to those supplies which have already been approved by the Department of Health of the State of New Jersey, but will apply to all future applications being within the limitations of the resolution.

Pollution of the Waters of the Raritan River and its Tributaries

As a result of the investigation of the pollution of the waters of the Raritan River by the Port District Raritan Commission (the findings of which are incorporated in a "Report on Pollution of the Raritan River Prepared for the Port Raritan District Commission by the Department of Water Supplies and Sewage Disposal, Rutgers University," dated 1927, and in the report entitled "Methods for the Abatement of the Pollution of the Raritan River," prepared by a firm of consulting engineers), and various investigations by this department, potable water notices were served upon the municipalities of Somerville and Raritan, the Johns-Manville Corporation at Manville and the Pillar of Fire Institute at Zarephath, under date of March 4, 1930; action was also taken by the department on July 7, 1931, for issuance of notices, under the State Sewerage Act, Chapter 72 of the P. L. of 1900, and its amendments and supplements, upon fourteen (14) municipalities within the Raritan River basin, and on July 12, 1932, fourteen (14) additional notices were served, under the latter act, upon individuals, real estate associations and others sewering into private sewer lines and thence discharging into Raritan River or its tributaries.

The municipalities served with notices under the State Sewerage Act applied to the department for an extension of time in which to comply with the requirements of the order owing to financial

stringencies. Pursuant to this request, the department resolved at its meeting of February 2, 1932, "That the Chancellor of the State of New Jersey be respectfully petitioned to enter decrees by consent in suits heretofore instituted or hereafter to be instituted by the State Department of Health against the said municipalities where the defendant municipality is willing to consent thereto, whereby the defendant municipality shall be directed to cease the pollution of the Raritan River and Raritan Bay and their tributaries by discharging raw domestic sewage or partially treated sewage therein within two years from the date of the decree with leave to the defendant municipality to apply for an extension of the time limited by the decree should financial conditions not improve sufficiently to warrant the defendant in proceeding with the necessary works to comply therewith;" and, "That suits be instituted and/or prosecuted in all cases in which the respective municipalities are unwilling to consent to the entry of a decree substantially to the effect aforesaid;" and, "That a copy of this resolution be mailed to each of said municipalities and to the Attorney General of the State of New Jersey with instructions to proceed accordingly."

Pursuant to the second provision of the above resolution, a court suit was instituted against the municipality of Somerville, which cause was heard November 14, 1932, in the Court of Chancery in the presence of Russell E. Watson, Esquire, appointed Deputy Attorney General, of counsel with the complainant, and Merritt Lane, Esquire, of counsel with the defendant. Pleadings, proofs, exhibits and arguments of counsel were presented at that time. Briefs further supporting the above were submitted to the Court of Chancery at a later date. A Final Decree in this matter has not been issued up to the time of this writing.

The necessary prosecution against the town of Raritan, Johns-Manville Corporation and the Pillar of Fire Institute is being held in abeyance pending the decision of the court in the case of Somerville.

In addition to the above work there have been made, as listed in the following table No. 3, during the year, inspections relating to:

Water:

Special water, including complaints and conferences	395
Swimming pools and bathing beaches	43

Sewage:

Special sewage and trade wastes, including construction work	348
Complaints and conferences	72

One hundred and eleven certificates were issued to railroads, vessel and airway companies for the use of water upon interstate carriers. One hundred and fifteen man-working days were spent in the collection of samples from stream sampling stations; 8½ man-working days were spent in attending court trials and serving court papers; 25½ man-working days were spent in attending conventions; 22½ man-working days were spent in collecting surf samples along the North Jersey coast; 22 man-working days were spent in inspecting sewage outfalls along the North Jersey coast, and 27 man-working days were spent in stream survey work.

The following man-working days were spent in the investigation of water purification and/or treatment plants at:

Clinton (Clinton Water and Water Supply Company)	7½
Millville (Millville Water Company)	4½

The following man-working days were spent in the investigation of sewage treatment plants at:

Bergenfield-Dumont (joint plant)	15½
Bradley Beach	15
Chatham-Madison	22½
Freehold	8½
Keyport	14
Lakelands (Camden County Institutions)	10½
Long Branch (municipality—2 plants)	12
Morristown	32½
North Brunswick Township	11
Ocean Township	10½
Spring Lake	13
Tenafly	26

Sanitary surveys were made on the Peckman River requiring 32 man-working days, Inside and Outside Thorofares in Atlantic City and vicinity requiring 25 man-working days.

Sanitary inspections were made upon the following streams during the year:

Assunpink Creek, tributary to Delaware River
Delaware River
Green Brook, tributary to Raritan River
Tributary to Hudson River
Matawan Creek, tributary to Raritan Bay
Metedeconk River
Mine Brook, tributary to North Branch Raritan River
Mohawk River
Pascack Brook, tributary to Hackensack River
Pensauken Creek, tributary to Delaware River
Peckman River
Pequannock River
Rahway River
Ramapo River
Raritan River
Raritan Bay
Tributary to Wallkill River
Tributary to Whippany River
Whippany River

Stream pollution investigated	37
Notices issued to individuals and companies to cease stream pollutions	37
Reinspections of stream pollutions made	23
Cases of stream pollutions found to be abated	15
Cases for abatement of pollutions referred for prosecution to Attorney General	8
Cases against stream polluters held in abeyance	14
Notices issued upon municipalities or sewer companies to cease the discharge of raw or insufficiently treated sewage into the waters of the State and/or to alter, add to or improve sewage treatment works	16
Notices issued to operators of sewage treatment plants to comply with requirements of the department	2
Notices issued upon municipalities and sewer companies to employ licensed operators at sewage treatment plants	7
Notices issued upon municipalities and water companies to improve water supplies	17
Notices issued upon distributors of potable water to cease the supplying of water to the public until the source of supply is approved	2
Cases referred to Attorney General for prosecution of municipalities or companies for failure to improve water supplies	4

Hackensack Valley Sewerage District

Since the approval on March 26, 1926, of Chapter 173 of the P. L. of 1926, which forbade the discharge of any sewage or polluting matter into the waters of the Hackensack River above the mouth of Bellman's Creek, or into any tributaries, including Bellman's Creek, of the Hackensack River, which empty into said river above the aforementioned point after May 1, 1930, unless the sewage was subjected to a minimum purification process, including sedimentation and intermittent sand filtration, and under which act the time limit of May 1, 1930, has been extended in the several years since its adoption to various dates, the last being May 1, 1933, statutes have been enacted creating the Hackensack Valley Sewerage District and Commission. These statutes provided for the investigation by the Commission of methods and plans for relieving the Hackensack River and its tributaries from pollution and preventing pollution of the river.

During the present session of the Legislature of 1933, a bill was introduced which has been enacted into law and is known as Chapter 288 of the P. L. of 1933, entitled "A supplement to an act entitled 'An act to create a sewerage district to be called Hackensack Valley sewerage district, to authorize the appointment and define the powers and duties of the commissioners therefor, to provide a plan for the prevention of the pollution of the Hackensack River and its tributaries and to authorize the raising and expenditure and payment of moneys necessary for this purpose,' approved April fifteenth, one thousand nine hundred and thirty," approved June 26, 1933, which act provides for the appointment of four commissioners, two from the county of Hudson and two from the county of Bergen, to be known as the Hackensack River Sewerage Commission, to act as an agency for the counties of Bergen and/or Hudson and any of the several municipalities of either of said counties for the purpose of acquisition, construction, operation and maintenance of the work determined to be necessary and proper for the relief and prevention of the pollution of the Hackensack River and its tributaries to any extent which may be authorized by contracts made between said Commission and said counties, or either of them, or any of the said municipalities in said counties.

The Commission is further authorized to do and perform all things which may be necessary or proper to have included in the Comprehensive Program of Public Works, authorized by section two hundred and two of the "National Industrial Recovery Act," the works necessary and proper for the relief and prevention of the pollution of the Hackensack River and its tributaries and the purification of the same, including such system or systems of sewage collection and disposal within the drainage area of said Hackensack River and its tributaries as may be desirable or proper, to provide for the construction and financing, or aid in the construction and financing thereof, as provided in section two hundred and three of said "National Industrial Recovery Act" and for such purposes, or any of them, to enter into such contract or contracts with the United States Government, or any of its agencies, including said Federal Emergency Administrator of Public Works, and, further, to do all things necessary or proper for the purpose of acquiring the necessary property and doing the work necessary and proper for the relief and prevention of the pollution of the Hackensack River and its tributaries and the purification thereof, including the construction of such sewerage system or systems, disposal plant or plants, as may be deemed necessary or proper in connection therewith.

The Commission under the former law creating the Hackensack Valley Sewerage District has been abolished by this act and the members of the Commission are required to turn over all of the books, records, maps, reports and other papers and documents in their possession to the new commission constituted under the provisions of Chapter 288 of the P. L. of 1933.

The statute restrains prosecutions under " 'An act to provide for the purification of the waters of the Hackensack River,' approved March twenty-sixth, one thousand nine hundred and twenty-six, until after May first, one thousand nine hundred and thirty-five."

New Rules and Regulations Governing the Issuance of Licenses to Operators of Sewage Treatment and Water Purification and/or Treatment Plants

The Rules and Regulations governing the issuance of licenses to operate water purification and/or treatment plants and sewage treatment plants were revised and adopted by the New Jersey State Department of Health on July 12, 1932, under authority of Chapter 23, P. L. of 1918.

The provisions of the revised Rules and Regulations, together with the resolution, which accompanied their adoption, are herewith reprinted:

Rules and Regulations

Whereas, The Department of Health of the State of New Jersey deems it necessary to change the Rules and Regulations governing examinations for licenses for operators of sewage treatment and water purification and/or treatment plants, which were amended and adopted by the said Department of Health on April 6, 1926, and at further times amended and supplemented, in order to better supervise and control polluting material discharged into the waters of the State and as an aid in the protection of the health of the consumers of the public potable water supplies; therefore,

Be it Resolved, By the Department of Health of the State of New Jersey, at the meeting held on the twelfth day of July, A. D. one thousand nine hundred and thirty-two, that the following Rules and Regulations be and are herewith adopted by the said Department of Health:

General

1. No fee shall be charged for the application, examination or license.

2. Applications: Applications are to be submitted at least one month prior to the date of the examination. Upon each application shall be included, besides the usual required information, full information relative to education, training and experience; and there shall be attached a small photograph of the applicant taken within a year of the filing of his application.

3. Definite qualifications, which are herewith to be set out in the Rules and Regulations for each grade of license, are to be shown by the applicant proposing to take an examination before his application can be accepted.

4. When an application for an examination has been accepted, experience and training will be considered sufficient for the particular license sought and no further experience rating will be necessary.

5. Classifications of licenses are herewith set out which will apply to specific classifications with special reference to size and location of plants.

6. The passing mark of 70 per cent. is required for the issuance of licenses, averaged from the written and oral examinations proportioned for the various classifications of licenses as set out herein.

7. Examinations are to be given twice a year, in the months of October and April.

8. Minimum requirements are herewith set up relative to the performance of duties and the operation of a plant by the holder of a license.

9. Where any applicant for a license to operate any water purification and/or treatment plant or sewage treatment plant in this State has failed at two successive examinations for licenses to operate water purification and/or treatment or sewage treatment plants, such applicant must wait for a period of one year to elapse from the time of the applicant's last examination before the said Department of Health will accept his application or permit him to take an examination to qualify at said examinations for a license as an operator of water purification and/or treatment or sewage treatment plants.

10. Examinations will be given under the direction of the examining board of the Department of Health and such examinations shall be practical in character and shall relate to those matters which will fairly test the ability of the person examined to discharge the duties for which a license is requested. The examination may be partly written and partly oral.

The department may refuse to examine or issue a license after examination to any person who has attempted to practice any deception or fraud in his application or his examination.

Any person successfully passing the examination shall have a license issued to him in the class and for the character of work for which the particular examination was given, and no person receiving a license shall fill a position calling for higher or different qualifications or greater knowledge than covered by the license granted to him.

11. When a license is issued or has been issued by the Department of Health of the State of New Jersey to any operator to supervise or operate any water purification and/or treatment or any sewage treatment plant in the State of New Jersey, before any person holding such a license can operate more than one such plant, a permit must first be obtained by such person from the Department of Health of the State of New Jersey; and, if the application of any operator to operate more than one such plant is denied by the Department of Health of the State of New Jersey, then if such operator shall in any way supervise or operate or attempt to supervise or operate more than one of such plants he shall be immediately summoned to appear before the Director of Health or the Department of Health of the State of New Jersey for a hearing; and, if no good cause for such action by such operator be shown, his license to operate a water purification and/or treatment or sewage treatment plant in this State shall be forthwith revoked by the Department of Health of the State of New Jersey.

12. When a permit is issued by the department for the construction of a new water purification and/or treatment or sewage treatment plant which will result in increasing the degree of water purification and/or treatment or sewage treatment or the sewage flow beyond critical amounts, the department, under a specific proviso will set out the class of operator that must be retained to operate the plant.

The classifications for licenses to operate water purification and/or treatment or sewage treatment plants are as follows:

* Classification of Licenses Required in the Operation of Water Purification and/or Treatment Plants

First Class:

All plants employing a combination of sedimentation, coagulation, filtration and sterilization process of purification and/or treatment or any combination of two or more of these processes with approved or accepted capacities of approximately 2,000,000 or more gallons per day; and, all other plants employing any purification and/or treatment process with approved or accepted capacities of approximately 20,000,000 or more gallons per day.

(The holder of this license may operate a plant classified under any class described herein.)

Second Class:

All plants employing a combination of sedimentation, coagulation, filtration and sterilization processes of purification and/or treatment with approved or accepted capacities of less than approximately 2,000,000 gallons per day; and, all other plants employing any purification and/or treatment process, not classified above, with approved or accepted capacities of approximately 10,000,000 to approximately 20,000,000 gallons per day.

(The holder of this license may operate a plant classified under any class described herein except First Class.)

Third Class:

All plants employing a combination of sedimentation, filtration and sterilization processes of purification and/or treatment or any combination of two of these processes with approved or accepted capacities of less than approximately 2,000,000 gallons per day; and, all other plants employing any purification and/or treatment process, not classified above, with approved or accepted capacities of approximately 2,000,000 to approximately 10,000,000 gallons per day.

(The holder of this license may operate a plant classified under Third Class and Fourth Class.)

Fourth Class:

All plants employing sterilization process of treatment alone with approved or accepted capacities of less than approximately 2,000,000 gallons per day.

(The holder of this license may operate a plant classified under Fourth Class only.)

---

* The State Department of Health may, in its discretion, and where it is deemed necessary, set up the classification of a license required in the operation of any specified water purification and/or treatment plant.

* CLASSIFICATION OF LICENSES REQUIRED IN THE OPERATION OF SEWAGE TREATMENT PLANTS

Grade A:

All plants employing the activated sludge process of treatment; all plants with approved or accepted capacities of approximately 500,000 or more gallons per day located on watersheds used for potable water supplies; and, all other plants with approved or accepted capacities of approximately 10,000,000 or more gallons per day.

(The holder of this license may operate a plant classified under any grade described herein.)

Grade B:

All plants employing a combination of sedimentation, separate sludge digestion, oxidation and sterilization processes of treatment for any period of time with approved or accepted capacities of approximately 50,000 to approximately 500,000 gallons per day located on watersheds used for potable water supply; all plants employing this combination of processes with approved or accepted capacities of less than approximately 10,000,000 gallons per day located on or adjacent to shellfish areas, which in the opinion of the State Department of Health influence these areas; and, all other plants employing this combination of processes with approved or accepted capacities of approximately 100,000 to approximately 10,000,000 gallons per day.

(The holder of this license may operate a plant classified under any grade described herein, except Grade A.)

Grade C:

All plants employing a combination of three processes of treatment included under DIVISIONS 1, 2 and 3 for any period of time with approved or accepted capacities of approximately 50,000 to approximately 500,000 gallons per day located on watersheds used for potable water supply; all plants employing one of these combinations of processes with approved or accepted capacities of less than approximately 10,000,000 gallons per day located on or adjacent to shellfish areas, which in the opinion of the State Department of Health influence these areas; and, all other plants employing one of these combinations of processes with approved or accepted capacities of approximately 100,000 to approximately 10,000,000 gallons per day.

Division 1. Sedimentation, oxidation and sterilization.

(The holder of this license may operate a plant classified under GRADE C—DIVISION 1, GRADE D—DIVISION 1 or DIVISION 2, GRADE E, GRADE F, or GRADE G.)

Division 2. Sedimentation, separate sludge digestion and sterilization.

(The holder of this license may operate a plant classified under GRADE C—DIVISION 2, GRADE D—DIVISION 1 or DIVISION 3, GRADE E, GRADE F, or GRADE G.)

* The State Department of Health may, in its discretion, and where it is deemed necessary, set up the classification of a license required in the operation of any specified sewage treatment plant.

Division 3. Sedimentation, separate sludge digestion, and oxidation.

(The holder of this license may operate a plant classified under GRADE C—DIVISION 3, GRADE D—DIVISION 2 or DIVISION 3, GRADE E, GRADE F, or GRADE G.)

Grade D:

All plants employing a combination of two processes of treatment included under DIVISION 1, 2, and 3 for any period of time with approved or accepted capacities of less than approximately 10,000,000 gallons per day located on or adjacent to shellfish areas, which in the opinion of the State Department of Health influence these areas; and, all other plants employing one of these combinations of processes with approved or accepted capacities of approximately 100,000 to approximately 10,000,000 gallons per day.

Division 1. Sedimentation and/or screening and sterilization.
Division 2. Sedimentation and oxidation.
Division 3. Sedimentation and separate sludge digestion.

(The holder of a GRADE D license may operate a plant classified under the *particular division* of his license, GRADE E, GRADE F, or GRADE G.)

Grade E:

All plants employing sedimentation and/or screening with approved or accepted capacities of approximately 2,500,000 to approximately 10,000,000 gallons per day not located on watersheds used for potable water supplies and not located on or adjacent to shellfish areas.

(The holder of this license may operate a plant classified under GRADE E, GRADE F, or GRADE G.)

Grade F:

All plants employing sedimentation and/or screening with approved or accepted capacities of approximately 250,000 to approximately 2,500,000 gallons per day not located on watersheds used for potable water supplies and not located on or adjacent to shellfish areas.

(The holder of this license may operate a plant classified under either GRADE F or GRADE G.)

Grade G:

All plants employing sedimentation and/or screening with approved or accepted capacities of approximately 100,000 to approximately 250,000 gallons per day not located on watersheds used for potable water supplies and not located on or adjacent to shellfish areas.

Grade S:

All plants (except activated sludge plants) employing one or more processes of treatment with approved or accepted capacities of less than approximately 50,000 gallons per day located on watersheds used for potable water supplies; and, all other such plants with approved or accepted capacities of less than approximately 100,000 gallons per day not located on or adjacent to shellfish areas.

(The holder of this license may operate the plant for which he is licensed or any plant which in the opinion of the State Department of Health is similar to that plant.)

The following qualification requirements apply to applicants for examinations for licenses to operate water purification and/or treatment or sewage treatment plants.

QUALIFICATIONS REQUIRED FOR ADMISSION OF APPLICANTS TO EXAMINATIONS FOR LICENSES TO OPERATE WATER PURIFICATION AND/OR TREATMENT PLANTS

Definitions:

1. TRAINING at an operators' short course or vocational school shall be credited only when the applicant has satisfactorily completed the prescribed course.

2. EXPERIENCE shall be interpreted as the time actually engaged as a licensed operator in charge of a water purification and/or treatment plant or engaged as an assistant at a plant requiring the classification of license desired.

First Class:

An applicant may offer any one of the four combinations:

	Training	*Experience*
1.	No	6 years
2.	Three years of operators' short course or vocational school, specializing in water treatment, or equivalent in the opinion of the State Department of Health; and,	3 years
3.	Two years of operators' short course or vocational school, specializing in water treatment, or equivalent in the opinion of the State Department of Health; and,	4 years
4.	College degree (Technical); and,	1 year

Second Class:

An applicant may offer any one of the four combinations:

	Training	*Experience*
1.	No	4 years
2.	One year of operators' short course or vocational school, specializing in water treatment, or equivalent in the opinion of the State Department of Health; and,	3 years
3.	Two years of operators' short course or vocational school, specializing in water treatment, or equivalent in the opinion of the State Department of Health; and,	2 years
4.	College degree (Technical); and,	1 year

Third Class:

An applicant may offer either combination:

	Training	*Experience*
1.	No	2 years
2.	One year of operators' short course or vocational school specializing in water treatment, or equivalent in the opinion of the State Department of Health; and,	1 year

Fourth Class:

Training and/or experience in the operation of a sterilization device acceptable to the State Department of Health.

QUALIFICATIONS REQUIRED FOR ADMISSION OF APPLICANTS TO EXAMINATIONS FOR LICENSES TO OPERATE SEWAGE TREATMENT PLANTS

Definitions:

1. TRAINING at an operators' short course or vocational school shall be credited only when the applicant has satisfactorily completed the prescribed course.

2. EXPERIENCE shall be interpreted as the time actually engaged as a licensed operator in charge of a sewage treatment plant or engaged as an assistant at a plant requiring the classification of license desired.

Grade A:

An applicant may offer any one of the four combinations:

	Training	*Experience*
1.	No	6 years
2.	Three years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	4 years
3.	Two years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	5 years
4.	College degree (Technical); and,	1 year

Grade B:

An applicant may offer any one of the four combinations:

	Training	*Experience*
1.	No	5 years
2.	Three years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	3 years

3. Two years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and, ... 4 years
4. College degree (Technical); and, ... 1 year

Grade C:

An applicant may offer any one of the four combinations:

	Training	*Experience*
1.	No	5 years
2.	Three years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	2 years
3.	Two years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	3 years
4.	College degree (Technical); and,	1 year

Grade D:

An applicant may offer any one of the four combinations:

	Training	*Experience*
1.	No	4 years
2.	Three years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	1 year
3.	Two years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	2 years
4.	College degree (Technical); and,	1 year

Grade E:

An applicant may offer any one of the three combinations:

	Training	*Experience*
1.	No	3 years
2.	One year of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	2 years
3.	Two years of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	1 year

Grade F:

An applicant may offer any one of two combinations:

	Training	*Experience*
1.	No	2 years
2.	One year of operators' short course or vocational school, specializing in sewage treatment, or equivalent in the opinion of the State Department of Health; and,	1 year

Grade G:

Training and/or experience, acceptable to the State Department of Health.

Grade S:

Training and/or experience, acceptable to the State Department of Health.

RATING FOR WRITTEN AND ORAL EXAMINATIONS

Sewage:

	Written	*Oral*
Grade A	100%	..
" B	90%	10%
" C	90%	10%
" D	85%	15%
" E	80%	20%
" F	75%	25%
" G	70%	30%
" S	80%	20%

Water:

First Class	100%	..
Second Class	90%	10%
Third Class	80%	20%
Fourth Class	70%	30%

The most important change in the procedure of examining and licensing applicants under the new Rules and Regulations is the requirement that the person proposing to take an examination satisfy definite qualifications relative to training and experience, which were set out for each particular grade or class of license, before his application for the examination will be accepted. Formerly there were no restrictions on admission to the examinations.

Of secondary importance is the new classification of licenses. In regard to sewage treatment plants, the grades apply to specific

processes of treatment and combinations thereof, with special reference to size and location of plants. The size of the plant considered corresponds to the amount of sewage per day to be treated. The location of the plant is important in relation to the size and use of the receiving waters, which factors control the processes of treatment required. In water purification or treatment plants these points vary somewhat, being principally the character of the water to be treated, which factor controls the processes employed to effect the production of pure water and the amount of water consumed.

The new classification makes it more practical to examine a person on the particular features of the plant which he proposes to operate and eliminates all question of doubt as to his qualifications if he contemplates transfering to another plant coming under the same classification. Instead of the six license headings for sewage treatment plants, of three divisions each under Primary and Primary-Secondary groups, there are now eight separate and distinct classifications of licenses, namely: GRADES A, B, C. D, E, F, G and S, with three divisions each under GRADE C and D.

Realizing that about one-third of the sewage treatment plants in the State are small plants owned by manufacturing concerns, various institutions, clubs, camps, private estates and small real estate developments which require only part time attention, some of which although small in size are located so as to require a high degree of treatment, it was decided to take them out of the regular order of licenses required for municipal plants and to establish a separate and distinct grade which would control all plants within this category, yet restricting the holder of such license to the operation of the individual plant at which he is engaged and for which he was examined. This license is termed GRADE S and has no relative place in the sequence of importance of the other grades applicable to the municipal plants.

One important change made in the classifications of water purification and treatment plants was the insertion of one new class, separating slow sand filter plants from the smaller rapid sand filter plants. Both formerly were included under Second Class, but the slow sand filters now are controlled by Third Class, while chlorine sterilization plants with a capacity under 2,000,000 gallons per day have been placed under Fourth Class.

The revised Rules and Regulations became effective upon adoption. In accordance with the provisions, examinations for licenses are given twice a year. During the fiscal year, examinations were given on October 27, 1932, and April 13, 1933. The number of applicants for examinations, the number admitted to the examinations, the number examined and the number of licenses issued for each grade and class to operate sewage treatment and water purification and/or treatment plants respectively are presented in the following tabulation:

Sewage	*No. of Applicants*	*No. of Applicants Accepted*	*No. Examined*	*No. of Licenses Issued*
Grade A	14	6	4	2
" B	9	8	7	4
" C, Division 1	4	3	3	2
" C, Division 2	3	2	2	1
" C, Division 3	0	0	0	0
" D, Division 1	10	7	7	4
" D, Division 2	10	8	8	1
" D, Division 3	0	0	0	0
" E	2	2	1	1
" F	8	4	4	3
" G	1	1	1	0
" S	18	18	17	8
	79	59	54	26
Water:				
First Class	10	10	10	7
Second Class	2	1	1	1
Third Class	5	3	3	3
Fourth Class	28	28	25	19
	45	42	39	30
Combined Total	124	101	93	56

Percentage of number accepted for the examination to number of applicants 81.45%
Percentage of number of licenses issued to number examined 60.0%

Under the new classification, the number of applicants was reduced from 161 during the year 1931-1932 to 124 during the past year. The restrictions included in the revised Rules and Regulations relative to qualifications for admission to the examinations allowed the department to accept 81.45 per cent. of the number making application for an examination.

Waters Used on Interstate Carriers

From year to year the number of certificates issued to railroad, vessel and airway companies for the use of water upon carriers engaged in interstate traffic has materially increased. During the past year, one hundred and eleven certificates were issued to such companies. The work entails considerable time inasmuch as special samples have to be collected from the supplies upon which the certificates are issued, field investigations made and the results must be tabulated and interpreted on each supply. These certificates are mailed in triplicate to the Treasury Department of the Federal Government, which forwards the same to the interstate carriers.

Physical Connections

Chapter 13 of the State Sanitary Code, enacted on September 18, 1928, provided that, after April 1, 1929, physical connections shall not be permitted except where such physical connections existed on April 1, 1929.

The following table contains data relating to the physical connections existing on April 1, 1929, and approved by the Department of Health of the State of New Jersey. Permits under the Code are reissued from year to year upon application made by the industry and approved by the local board of health within which territory the physical connections are maintained.

The following table No. 4 lists the physical connections between approved public supplies and unapproved private supplies:

TABLE No. 4—PHYSICAL CONNECTIONS BETWEEN APPROVED PUBLIC POTABLE WATER SUPPLIES AND UNAPPROVED PRIVATE WATER SUPPLIES

NAME OF MUNICIPALITY	NAME OF COMPANY	PUBLIC POTABLE WATER SUPPLY	UNAPPROVED WATER SUPPLY	NUMBER AND SIZE OF CONNECTION
Arlington	Du Pont Viscoloid Co., Inc.	Kearny Water Department (North Jersey District Water Supply Commission)	Drilled wells	1—4″ 6—6″
Avenel	Steel Equipment Corporation	Middlesex Water Company	Artesian well	2—6″
Bayonne	American Radiator Company	Bayonne Water Department (North Jersey District Water Supply Commission)	Rain water from reservoir	1—4″
Bayonne	The Babcock and Wilcox Co.	Bayonne Water Department (North Jersey District Water Supply Commission)	Salt water system	2—6″
Belleville	Eastwood-Nealley Corporation (formerly Eastwood Corp.) (originally Eastwood Wire Corporation)	Belleville Water Department (Newark Water Supply)	Passaic River	1—6″
Bloomfield	The Clark Thread Company	Bloomfield Water Department (Newark Water Supply)	Third River	1—10″
Bloomfield	Consolidated Safety Pin Company	Bloomfield Water Department (Newark Water Supply)	Tony's Brook	1—6″
Bloomfield	General Electric Co.	Bloomfield Water Department (Newark Water Supply)	Open reservoir—factory fire pump cistern	1—6″
Bloomfield	Thomas Oakes & Co., Inc.	Bloomfield Water Department (Newark Water Supply)	Third River	1—4″ 1—6″
Bloomfield	Westinghouse Lamp Co.	Bloomfield Water Department (Newark Water Supply)	Artesian well	1—6″
Bogota	Continental Paper Co.	Hackensack Water Company	Pump suction—Hackensack River	1—6″
Bogota	Federal Paper Board Company, Inc.	Hackensack Water Company	Hackensack River	1—6″
Bridgeton	Martin Dyeing and Finishing Company	Bridgeton	East Lake	1—8″
Burlington	Burlington Silk Mills, Inc.	Burlington	Spring water reservoir	1—6″
Burlington	U. S. Pipe and Foundry Company	Burlington	Delaware River	1—4″
Butler	American Hard Rubber Company	Butler	Pequannock River	1—8″
Butler	Pequanoc Rubber Company	Butler	Pequannock River	2—6″
Camden	Armstrong Cork Company	Camden	Delaware River and artesian well water	1—2½″ 1—3″
Camden	Campbell Soup Company	Camden	Delaware River	1—6″
Carlstadt	Franco-American Chemical Works, Inc.	Hackensack Water Company	Artesian well	1—6″
Carlton Hill (East Rutherford)	Standard Bleachery and Printing Company	Hackensack Water Company	Passaic River and artesian well	1—6″
Carteret	Foster Wheeler Corporation	Middlesex Water Company (Perth Amboy)	Private wells	1—6″
Clifton	Clifton Paper Board Company, Inc. (formerly Clifton Paper Mills	Passaic Valley Water Commission	Passaic river	1—6″
Clifton	Dundee Textile Company	Passaic Valley Water Commission	Dundee Canal	1—6″
Clifton	Eureka Printing Company	Passaic Valley Water Commission	Weasel Brook	1—6″
Clifton	Givaudan-Delawanna, Inc.	Clifton	Well and city water	1—6″

Clifton	Haberland Manufacturing Company	Jersey City	Reservoir fed by springs	1—6″
Clifton	Henry Doherty Silk Company (formerly Textile Buildings Company)	Passaic Valley Water Commission	Private supply and cistern	1—6″
East Newark	The Clark Thread Company	New York and New Jersey Suburban Water Company (Passaic Valley Water Commission)	Reservoir filled from city main	1—10″
East Newark	Stewart Hartshorn Company	New York and New Jersey Suburban Water Company (Passaic Valley Water Commission)	Fire protection and hot well	2—6″
East Orange	Crocker Wheeler Electric Manufacturing Company	East Orange	Well	1—8″ 1—6″
East Orange	General Electric Company	East Orange	Open reservoir, factory fire pump cistern (process water)	1—6″
East Orange	The A. P. Smith Manufacturing Company	East Orange	Deep well	1—8″ 1—6″
Edgewater	Aluminum Company of America (formerly The U. S. Aluminum Company)	Hackensack Water Company	Hudson River	1—6″ 2—8″
Edgewater	The Barrett Company	Hackensack Water Company	Hudson River	1—8″
Edgewater	Spencer Kellogg & Sons, Inc.	Hackensack Water Company	Hudson River	1—10″
Fairview	Bellman Brook Bleachery Company	Hackensack Water Company	Overpeck Creek and Wolf Creek	1—8″
Garfield	Garfield Worsted Mills	Garfield	Garfield Worsted Mill's general service water	1—6″
Garfield	Samuel Hird & Sons, Inc.	Garfield	Passaic River	1—6″
Garwood	Acolian Company (formerly Votey Organ Company)	Plainfield-Union Water Company	Driven well	1—8″
Garwood	Knickerbocker Ice Company	Plainfield-Union Water Company	Driven well	1—2″
Gloucester	Armstrong Cork Company	Gloucester City	Delaware River	1—8″
Gloucester	The Hinde & Dauch Paper Company	Gloucester City	Delaware River	1—6″
Gloucester	The Lang Company	Gloucester City	Delaware River	1—4″
Hackensack	Harper Brothers, Inc. (formerly Wm. Campbell Wall Paper Co.	Hackensack Water Company	Reservoir filled from brook	1—6″
Harrison	Hyatt Roller Bearing Company	New York and New Jersey Suburban Water Company (Harrison Water Department)	Deep wells	1—6″ 1—8″
Harrison	R. C. A. Radiotron Company, Inc.	New York and New Jersey Suburban Water Company (Harrison Water Department)	Plant fire reservoir	2—8″
Harrison	Stewart Hartshorn Company	New York and New Jersey Suburban Water Company (Harrison Water Department)	Fire protection and hot well	1—6″
Hightstown	Hightstown Rug Company	Hightstown	Rocky Creek	1—6″
Hoboken	United Drydocks, Inc. (Fletcher Plant)	Hoboken (Jersey City Water Department)	Hudson River	1—6″ 1—8″
Hohokus	Hohokus Bleachery	Hohokus	Hohokus Creek	1—8″
Jersey City	The Clark Thread Company	Jersey City	Reservoir	1—6″ 1—8″
Jersey City	Colgate-Palmolive-Peet Company	Jersey City	Hudson River water	2—10″
Jersey City	Consolidated Laundries Corporation	Jersey City	Cistern	1—6″
Jersey City	Eureka Fire Hose Manufacturing Company	Jersey City	Cistern	1—8″
Jersey City	P. Lorillard Company	Jersey City	Rain water and make-up water from city main	2—8″
Jersey City	The Riegel Sack Company	Jersey City	Cistern	2—6″

TABLE No. 4—PHYSICAL CONNECTIONS BETWEEN APPROVED PUBLIC POTABLE WATER SUPPLIES AND UNAPPROVED PRIVATE WATER SUPPLIES—Continued

NAME OF MUNICIPALITY	NAME OF COMPANY	PUBLIC POTABLE WATER SUPPLY	UNAPPROVED WATER SUPPLY	NUMBER AND SIZE OF CONNECTION
Jersey City	Peter J. Schweitzer, Inc.	Jersey City	Cistern	1—6″
Kearny	Barbour Flax Spinning Company	Kearny (North Jersey District Water Supply Commission)	Passaic River and three wells in north yard	2—6″
Kearny	Congoleum-Nairn, Inc.	Kearny (North Jersey District Water Supply Commission)	Plant system from Passaic River	2—8″ 1—6″
Kearny	Seaboard By-Product Coke Company	Kearny (North Jersey District Water Supply Commission)	Plant service water, Hackensack River	2—8″
Kearny	Swift and Company	Kearny (North Jersey District Water Supply Commission)	Well water	1—8″
Kearny	Western Electric Company (formerly Ford Motor Company)	Kearny (North Jersey District Water Supply Commission)	Passaic River	2—12″ 1—8″
Keyport	Whitall Tatum Company	Keyport	Gravity tank filled with deep well water	1—6″

The Disposal of Sewage From North Jersey Seashore Municipalities

For several years past, the department has been endeavoring to improve the sewage treatment plants at the North Jersey coast resorts in order to make more safe for bathing purposes the beaches in the municipalities along the North Jersey coast. A great number of these municipalities have adhered to the requirements of the department and have improved their municipal sewage treatment works, thereby protecting adjoining and other nearby municipalities which use the waters of the Atlantic Ocean for bathing purposes during the summer season. One of these municipalities is under court orders to improve its sewage treatment works, and, to forestall such improvement, it had prepared a bill for submission to the Legislature which has been enacted into law and is known as Chapter 50 of the P. L. of 1933. This statute will allow municipalities under court orders to appeal to the court for an extension of time in the improvement of their municipal sewage treatment works. The law is printed in the forepart of the report.

In 1928 there were eighteen sewage treatment plants serving the fifteen municipalities from Long Branch to Point Pleasant, which plants, having sedimentation as the only method of treatment, discharge their plant effluents into the Atlantic Ocean. In the summer of 1928, before chlorination was installed as a method of treatment, the samples for bacteriological examination collected from the surf at sixty beaches located in these municipalities, indicated the average B. Coli content to be 56.7 per cubic centimeter on ebb tide and 49.0 per cubic centimeter on flood tide. From the flow figures determined during the inspections from 1930 to 1932, it was found that approximately 12,805,200 gallons of sewage were being discharged daily into the Atlantic Ocean from these fifteen municipalities.

During the summer of 1930, surf samples were again collected at the bathing beaches from Long Branch to Point Pleasant. At that time 75 per cent. of the sewage treatment plants serving the fifteen municipalities had installed and in operation chlorine apparatus. The chlorinated sewage was approximately 45 per cent. of the total volume of sewage discharged from the afore-

mentioned area. The average density of B. Coli in the samples collected from the sixty bathing beaches was 1.64 per cubic centimeter on ebb tide and 3.4 per cubic centimeter on flood tide.

In July, 1932, similar collections of surf samples were made at all beaches extending from Keyport to Bayhead. At that time 80 per cent. of the sewage treatment plants serving the shore municipalities, from Long Branch to Point Pleasant, were using chlorine as part of the treatment process. Approximately 77 per cent. of the total volume of sewage discharged from the above area was being chlorinated. The average density of B. Coli in the samples collected was 0.54 per cubic centimeter on flood tide and 0.84 per cubic centimeter on a split tide.

The above data follows in tabulated form:

Average B. Coli Content per Cubic Centimeter for Sixty Bathing Beaches from Long Branch to Point Pleasant, Inclusive

Year	*Flood Tide*	*Ebb Tide*
1928 (before chlorination)	49.0	56.7
1930 (with 75% of sewage treatment plants chlorinating 45% of the sewage discharged)	3.4	1.64
1932 (with 80% of the sewage treatment plants chlorinating 77% of the sewage discharged)	0.54	0.84 (split tide)

The department is continuing to make investigations at the sewage treatment plants, to collect surf samples and inspect the sewer outfall lines along the North Jersey coast.

Special investigations have been carried on at sewage treatment works in several of the North Jersey seashore municipalities under orders of the New Jersey State Department of Health to improve these works. These municipalities have not as yet complied with the orders of the department, the investigations being made for the purpose of obtaining the necessary data for court proceedings.

Inspections have been carried on, as in the past, to determine as to the serviceability of the ocean outfall pipe lines at the North Jersey coast resorts for properly disposing of the sewage effluent being discharged from the municipal sewerage works into the Atlantic Ocean and tributary waters. In four of the municipalities breaks were found to exist in these lines which necessitated the

department's issuance of immediate orders against the municipalities to repair the lines so as to protect bathing and shellfish waters.

Bathing Pools

The department, desiring to formulate means for the sanitary protection of the bathing public and to provide a uniform design for the construction of pools in this State, adopted the following preamble and resolution at a meeting held on September 13, 1932:

"Whereas, Public swimming pools, indoor and outdoor, are potentially important sources of dissemination of disease; and

"Whereas, The number of such pools in the State is rapidly increasing, some of them in small communities where they are not subject to adequate local health codes and inspections; and

"Whereas, There is no State law or State regulation governing such public utilities; therefore,

"Be it Resolved, That the Bureau of Engineering, with the aid of other Bureaus, be instructed to prepare and present to the Board not later than its December, 1932, meeting, tentative data and recommendations for the drawing of a bill to present to the next legislature looking to suitable regulation of public swimming pools."

In the discussion of this law before the meeting of the Health Officers Association in January, 1933, a committee from that Association was appointed to meet with representatives of the Department to provide in the bill a means whereby local boards of health would have concurrent jurisdiction with the New Jersey State Department of Health over supervision of pools, allowing the design of construction to remain as provided for in the original bill under the authority of the State Department of Health. This bill and the committee substitute were not passed and no law has been enacted upon the subject of bathing pools in New Jersey. The present jurisdiction over bathing pools is lodged in the local administrations of municipalities. A copy of the proposed bill, as amended, submitted to the 1933 Legislature for action, is as follows:

Committee Substitute for Assembly No. 167

An Act concerning swimming pools and baths.

Be it enacted *by the Senate and General Assembly of the State of New Jersey:*

1. From and after the first day of October, one thousand nine hundred and thirty-three, no person shall construct, alter, add to, improve, operate, maintain

or conduct any swimming pool or bath in this State, without first making application and obtaining a license therefor from the Department of Health of the State of New Jersey, which license shall expire on the thirtieth day of September of each year and shall be renewed annually; *provided, however,* that in the case of new swimming pools and/or baths the application shall first be approved as to the location and establishment of said swimming pool and/or bath by the local board of health or body exercising the powers thereof within the jurisdiction where said swimming pool and/or bath is located; *and provided further,* when application is made for a license or renewal of license for the operation, maintenance and/or conduction of any established swimming pool and/or bath, said application shall first be approved by the local board of health or other body exercising powers therein. The Department of Health of the State of New Jersey may, in its discretion, issue or refuse to issue a license for the aforementioned purpose or purposes.

2. The Department of Health of the State of New Jersey is hereby authorized and empowered to make, adopt and enforce such rules and regulations as in its opinion may from time to time be necessary for the design, construction, alteration, addition to or improvement of, the operation, maintenance and/or conduction of any swimming pool and/or bath, and the sanitary conditions of the premises upon which, or in which, any such swimming pool and/or bath is located, as well as such swimming pool and/or bath, and the use by bathers or spectators of any said swimming pool and/or bath, and the premises thereof, and as to the amount, character, quality, purification and/or treatment of the water used in such swimming pool or bath, and the discharge of such water therefrom directly into any stream of water in this State, and for the location of any swimming pool and/or bath where the same is situate in or on any stream in this State; *provided,* that in such rules and regulations the minimum requirement for the quality of the water used in any such swimming pool and/or bath shall provide that not more than two out of five samples of the water supply admitted to the swimming pool and/or bath, or of the water of any part of the said swimming pool and/or bath, when such swimming pool and/or bath is in use, collected on the same day, or not more than three out of any ten consecutive samples, collected on different days, shall show a positive test for the organisms of the B. Coli group in ten cubic centimeters of water.

3. For the purpose of this act the rules and regulations hereunder established relating to the operation, maintenance and/or conduction of any swimming pool and/or bath, and the sanitary conditions of the premises upon which, or in which, any such swimming pool and/or bath is located, as well as such swimming pool and/or bath, and the use by bathers or spectators of any said swimming pool and/or bath, and the premises thereof, and as to the amount, character, quality, purification and/or treatment of the water used in such swimming pool and/or bath, and the discharge of such water therefrom directly into any stream of water in this State, and for the location of any swimming pool and/or bath where the same is situate in or on any stream in this State; *provided,* that in such rules and regulations the minimum requirement for the quality of the water used in any such swimming pool and/or bath shall provide that not more than two out of five samples of the water supply admitted to the swimming pool and/or bath, or of the water of any part of the said swimming pool and/or bath, when such swimming pool and/or bath is in use, collected on the same day, or not more than three out of any ten consecutive samples,

collected on different days, shall show a positive test for the organisms of the B. Coli group in ten cubic centimeters of water, shall be considered as minimum rules and regulations in so far as local boards of health or other bodies exercising the powers therein have jurisdiction in such matters.

4. When in the opinion of the Department of Health of the State of New Jersey the provisions of this act or the rules and regulations of the Department of Health adopted hereunder have been violated by any person, the Department of Health of the State of New Jersey shall have the power to suspend or revoke any permit or license issued by the said Department.

5. Plans, specifications and other required information and data relating to the construction, equipment, alteration, addition to or improvement of, and the operation, maintenance and conduction of any swimming pool and/or bath shall be filed with the Department of Health of the State of New Jersey in manner set out in the rules and regulations of the said Department of Health adopted under this act, and the plans and specifications must first be approved by the Department of Health of the State of New Jersey before any work upon any swimming pool and/or bath is begun.

6. The Department of Health of the State of New Jersey shall have supervision over the construction, alteration, addition to or improvement, from a sanitary standpoint, of all swimming pools and/or baths, as well as the supervision over the operation, maintenance and/or conduction of any such swimming pool and/or bath and the premises thereof. Local boards of health or other bodies exercising the powers thereof may enforce the provisions of this act as well as the rules and regulations adopted by the Department of Health of the State of New Jersey by virtue of the authority herein granted said Department of Health, in so far as said provisions and rules and regulations relate to the operation, maintenance and/or conduction of swimming pools and/or baths, and the sanitation of the premises wherein such swimming pools and/or baths are located.

7. Representatives of the Department of Health of the State of New Jersey, and the local boards of health or other bodies exercising the powers thereof having jurisdiction in the premises, are hereby authorized and empowered to make inspections of swimming pools and/or baths and the premises thereof and to obtain samples, and shall at all times for said purposes have access to any and all swimming pools and/or baths and the premises whereon or wherein same is or are located. Any person who shall interfere with or prevent any representative of the Department of Health of the State of New Jersey or representative of the said local boards of health or other bodies exercising the powers thereof from carrying out any of the provisions of this section shall be guilty of a violation of this act.

8. The Department of Health of the State of New Jersey, or the Director of Health of said department, may require, under the provisions of this act or the rules and regulations adopted by the said Department of Health, a change in the construction, equipment, alteration, addition to, improvement of, or operation, maintenance and/or conduction of any swimming pool and/or bath, under notice given to any person operating, maintaining and/or conducting said swimming pool and/or bath within a period of time specified in said notice which shall not exceed three months from the date of the issuance of such notice.

9. Upon evidence duly ascertained by the Department of Health of the State of New Jersey or furnished to said department by any local board of health or other body exercising the powers thereof in matters over which said local boards of health or other bodies exercising the powers thereof have jurisdiction, that the person responsible under the license provided for by this act is violating any of the provisions of the act or the rules and regulations adopted hereunder, then it shall be the duty of the Department of Health of the State of New Jersey or the Director of Health of said department upon proof of allegations, after hearing, to revoke said license; *provided, however,* that the Department of Health of the State of New Jersey when in its judgment, or the Director of Health when in his judgment, the protection of the public health warrants, may, before hearing, suspend said license pending said hearing, and, in the event that said license is suspended, it shall be unlawful for said person to continue the construction, alteration, addition to, improvement of, operation, maintenance and/or conduction of any swimming pool or bath and the premises thereof.

10. Any person violating any of the provisions of this act or the rules and regulations adopted under it by the Department of Health of the State of New Jersey shall be subject to a penalty of not less than twenty-five dollars ($25.00) nor more than one hundred dollars ($100.00) for each and every violation; and each day's continuance after the date of expiration of any notice of such violation shall constitute a separate violation, and any penalty or penalties incurred under any of the provisions of this act or the rules and regulations of the Department of Health of the State of New Jersey adopted hereunder, may be recovered with costs in a summary proceedings in any competent court of jurisdiction in this State by the Department of Health of the State of New Jersey, or by any local board of health or body exercising the powers thereof having jurisdiction in the premises; and further, the Department of Health of the State of New Jersey, or any local board of health or body exercising the powers thereof having jurisdiction in the premises, whether or not the penalty or penalties above prescribed shall have been sued for or recovered, may file a bill in the Court of Chancery for an injunction to restrain any violation of this act or the rules and regulations adopted hereunder and for such other and further relief in the premises as the Court of Chancery may deem proper; in the case of the Department of Health of the State of New Jersey the bill shall be filed in the name of the State, on the relation of said Department of Health, for an injunction to prohibit the further violation of the provisions of this act or the rules and regulations adopted hereunder by the Department of Health of the State of New Jersey, and every such action by the Department of Health of the State of New Jersey shall proceed in the Court of Chancery according to the rules and practice relating to bills filed in the name of the Attorney General on the relation of individuals; cases of emergency shall have precedence over other litigation pending at the time in the Court of Chancery, and may be heard on final hearing within such time and on such notice as the Chancellor shall direct.

Any and all moneys obtained through license fees or from penalties collected under the provisions of this act by the Department of Health of the State of New Jersey shall be payable to the Department of Health of the State of New Jersey, and the said Department of Health shall transmit the same to the State Treasurer, who shall place said moneys to the credit of and for expenditure by the said Department of Health in the enforcement of the provisions of this act

and the rules and regulations adopted hereunder by the Department of Health of the State of New Jersey; any moneys obtained through penalties recovered by any local boards of health or bodies exercising the powers thereof shall be paid into the treasury of the municipality.

11. Nothing in this act contained shall prevent any local board of health or other body exercising the powers thereof from making, adopting and enforcing rules and regulations governing the operation, maintenance and/or conduction of any swimming pool and/or bath and the premises thereof.

12. Definitions:

(a) The word "person", as used in this act, shall be construed to mean and include both the singular and the plural, as the case may demand, and shall include municipalities, counties and boards, departments, commissions, or other bodies of such counties or municipalities, as well as individuals, corporations, companies, firms, partnerships, school boards, associations, societies, religious or charitable organizations, institutions, clubs, and any and all other bodies of persons associated for any purpose whatever.

(b) Swimming pools and/or baths shall be construed to mean and include all pools or baths outdoor and indoor, which are partially or entirely of artificial construction, or any waters impounded or walled in whole or in part for swimming, bathing or wading in this State, and shall exclude any swimming or wading pool and/or bath established and maintained upon any dwelling premises, or the riparian waters adjoining such dwelling premises, by any individual for his own or his family's use or the use of the visitors or guests of his household.

13. Each person shall pay to the Department of Health of the State of New Jersey fees as follows:

For the examination of plans and specifications and other engineering data which have for their purpose the establishment of new swimming pools and/or baths $25.00

For the issuance and again for the renewal of any license under the provisions of this act $25.00

14. No county or municipality, and no board, body, department or commission of said county or municipality, or any school board, religious or charitable organization, shall be required to pay for any license issued in accordance with the provisions of this act, for constructing, operating, maintaining or conducting a swimming pool or bath or for the renewal of any license granted under the provisions of this act for the operation, maintenance or conducting of any swimming pool or bath in this State.

15. All acts and parts of acts inconsistent with the provisions of this act be and same are hereby repealed; and, if any section or parts thereof of this act shall be questioned in any court, and shall be held to be unconstitutional and void, the sections or parts thereof so declared to be invalid shall be exscinded, and the balance of the act shall stand as though said sections or parts thereof had never been included within the provisions of this act.

16. This act shall take effect on the first day of October, one thousand nine hundred and thirty-three.

Stream Sampling Stations

In assuming the stream sampling station work in the State, which in the past was conducted to a limited extent by the State

Water Policy Commission as a guidance toward the use of surface water supplies, stream sampling stations were set up by the Department of Health of the State of New Jersey for the purpose of collecting samples and gathering the necessary data that would lead in time to:

1. The protection of existing and proposed public potable water supplies.
2. The sanitary protection of recreational centers used for bathing purposes.
3. The determination of sources of pollutions.
4. The protection of fish life.
5. The protection of stream waters for agricultural use, irrigation, stock watering, etc.
6. The quality and character of water which may be used by various industries in manufacturing processes.

This work was begun in August 1932, sampling stations being established on all streams of the State, the locations being governed by sewage and trade waste treatment plants, water supply intakes and recreational centers existing and proposed on such streams.

Twenty-five stations were established in the Camden area, covering the watersheds of Newton, Cooper, Woodbury, Timber and Rancocas Rivers and Creeks, a total area of approximately 750 square miles, the water from which receives the effluents from about 30 sewage treatment plants as well as trade waste plants. About 50 sampling stations were established in the congested area of Northern Jersey on the watersheds of the Raritan, Rahway, Elizabeth, Hackensack, Passaic, Whippany and Rockaway Rivers, covering an area of approximately 2,500 square miles, the waters of which receive the effluents from about 80 sewage treatment plants along with trade waste plants.

There are a total of 204 collection points; from 158 of these points samples are collected by this bureau, from 42 of the points samples are collected by the State Water Policy Commission and analyzed by this department, and from 4 of the points samples are collected and analyzed by the North Jersey District Water Supply Commission.

Collections are carried out under a routine schedule and are rotated so that samples from every collection point are taken under all seasonal variations.

Of the 158 collection points from which samples are taken by the Bureau of Engineering 104 samples are collected four times a year and 54 samples twice a year, the latter being from stations located in the vicinity of recreational centers and are collected during the summer season only.

The importance of the work is shown in the numerous requests received by the department for information upon the use of certain waters for potable and recreational purposes, the use of the streams for the dispersing of effluents from sewage and trade waste treatment plants, as well as the use of waters in industrial processes. Graphical charts and other data are kept in such form that the department can immediately determine as to the quality and character of the water from the streams at the different sampling points.

Where heavy pollution is shown to occur in any of the results of the analyses of the samples collected sanitary surveys are immediately made by the bureau's representatives to determine the source of the pollution and adopt means for the abatement of the same.

The Establishment of Factories on Watersheds

During the past year, under the provisions of Chapter 280, P. L. of 1921, the department approved of applications for the construction of industrial plants upon the watersheds in this State as follows:

Montvale—Montvale Service Station (Joseph Scalabrini)—Cider Factory, Bear Brook, a tributary of Hackensack River.

Old Tappan—Bergen Cider Mill (Frank Griffin)—tributary of Hackensack River.

Boonton—(Carman & Company)—Soap Factory, tributary of the Passaic River.

Since the adoption of the aforementioned law in 1921, there have been fifteen applications granted by the department for the establishment of factories on the watersheds in this State.

The following table No. 5 lists the public potable water supplies in operation in the State at the end of the fiscal year, June 30, 1933:

TABLE No. 5.—DESCRIPTIVE DATA OF PUBLIC WATER SUPPLIES IN NEW JERSEY

OWNER AND MUNICIPALITIES SUPPLIED	SOURCE OF SUPPLY	TREATMENT	Population 1930 Permanent	Population Supplied Estimated	1932 Consumption in Thousand Gals. Per Day	Gravity or Pumped	Hardness	Alkalinity
Allendale (Municipality)	2 driven wells, 450′-500′ deep		1,730	1,730	70	P	124.4	81.1

TABLE No. 5.—DESCRIPTIVE DATA OF PUBLIC WATER SUPPLIES IN NEW JERSEY (Continued)

OWNER AND MUNICIPALITIES SUPPLIED	SOURCE OF SUPPLY	TREATMENT	Population 1930 Permanent	Population Supplied Estimated	1932 Consumption in Thousand Gals. Per Day	Gravity or Pumped	Hardness	Alkalinity
Plausha Park Land Co. (Montville Twp., Towaco Section)	1 driven well, 200′ deep		2,467	200*	1	P	103.0	118.0
Point Pleasant Beach (Municipality)	7 driven wells, 150′ deep		1,844	1,844*	554	P	36.4	30.0
(Point Pleasant)			2,058	2,058*				
Pottersville Water Co.	Tributary of Black River	Chlorination						
(Bedminster Twp., Pottersville Section, part)			1,374	200				
(Tewksbury Twp., part)			1,119	50	171	G	....	34.4
Pompton Lakes (Municipality)	Buys water from Boro of Butler and sells water to Boro of Wanaque and Riverdale		3,104	3,104				
(Wanaque)			3,119	3,000				
(Riverdale)			1,052	500				
Princeton Water Co. (Princeton)	7 driven wells, 300′-615′ deep	Chlorination (part)	6,992	6,922	995	P	64.2	30.0
(Princeton Twp.)			2,738	1,200				
Property Owners Cooperative Assoc. of Middlesex County, Inc. (Helmetta, Jamesburg Park Section)	1 driven well, 224′ deep		801	200	....	P	29.9	7.7
Prospect Point Water Co. (Prospect Point Section of Lake Hopatcong in Jefferson Twp.)	1 driven well, 369′ deep		1,254	150*	2	P	38.5	37.0
Rahway (Municipality)	Rahway River	Rapid sand filtration (gravity) and chlorination	16,011	16,011	3,056	P	101.7	60.5
Ramsey (Municipality)	3 driven wells, 203′-419′ deep		3,258	3,258	177	P	77.1	65.0
Read, A. J. (Long Valley section of Washington Twp.)	Fairmount Spring on Fox Hill		1,615	100	....	G	24.3	17.0
Red Bank (Municipality)	10 driven wells, 75′-700′ deep	Aeration, sedimentation, rapid sand filtration (pressure) for iron removal, ammoniation and chlorination for algae	11,622	11,022*	752	P	115.2	106.3
(Fair Haven, part)			2,260	260				
Reid, Arthur (Mt. Olive Twp., Outlook Park, Rudd Lake Section)	Springs		1,235	50*	....	G	37.0	33.5
Ridgewood (Municipality)	15 driven wells, 200′-261′ deep	Chlorination	12,188	12,188	1,353	P	75.5	50.5
(Glenn Rock)			4,369	4,369				
(Hohokus)			925	925				
(Midland Park)			3,638	3,638				

Remington, John C., Jr. (Fortescue Section of Downe Twp.)	1 driven well, 300′ deep		1,574	10	....	P	74.3	90.0
Riddle, Frank (Hampton)	1 driven well, 64.5′ deep		861	75	....	..	72.9	31.0
Riegel Paper Corporation								
(Hughesville Mill) (Holland Twp.)	Brook	Chlorination	994	....	....	P	51.4	40.0
(Milford Mill) (Milford)	7 dug wells, 40′ deep	Chlorination	....	....	....	P	85.7	74.0
(Warren Glenn, Pohatcong Twp.)	1 dug well, 22′ deep	Chlorination	1,974	....	....	P	146.8	90.8
Ringwood Company, The								
(The Awosting Section of West Milford Twp.)	2 driven wells, 136-365′ deep		1,901	250	....	P	64.5	83.6
(Lake Erskine Manor Section of Ringwood Borough)	3 driven wells, 164-375-505′ deep		1,038	200	....	P	54.8	58.3
Riverton-Palmyra Water Co.	4 driven wells, 20′-260′ deep							
(Riverton)			2,483	2,483	691	P	67.0	13.8
(Cinnaminson Twp., part)			2,277	1,000				
(Palmyra)			4,968	4,968				
Rockaway (Municipality)	1 driven well, 50′ deep (2 driven wells, 245′-300′ deep, held in reserve)		3,132	3,132	153	P	64.2	69.8
Roebling's Sons Co., John A. (Florence Twp., Roebling Section)	1 driven well, 310′ deep (emergency supply, Delaware River)	Rapid sand filtration (gravity) and chlorination on emergency supply	7,824	3,500	274	P	64.9	46.4
Salem (Municipality)	34 driven wells, 135′-250′ deep; tributary to Alloway Creek	Rapid sand filtration (gravity) and chlorination	8,074	8,074	1,012	P	56.7	30.7
(Quinton Twp.)			1,166	500				
Sayreville (Municipality)	Buys water from City of South Amboy. Sells water to Laurence Harbor Heights Co., Laurence Harbor and Cliffwood Beach Water Co.		8,658					
Schulz, A. Z. (Bellmawr, part)	1 driven well, 226′ deep		1,123	500	....	P	73.6	81.5
Sea Girt (Municipality)	3 driven wells, 760′ deep; 1 dug well, 30′ deep		386	386*	132	P	33.5	36.2
Sea Isle City (Municipality)	2 driven wells, 860′-870′ deep		850	850*	241	P	36.4	81.0
Seaside Heights (Municipality)	1 driven well, 460′ deep		399	399*	80	P	8.7	25.8
(Sunset Island, west of Seaside Heights)			20	20*				
Seaside Park (Municipality)	3 driven wells, 139′-525′ deep	Aeration and rapid sand filtration (gravity) for CO_2 and iron removal	571	571*	50	P	9.9	79.7
Sewell Water Co. (Sewell)	1 driven well, 80′ deep		2,677	650	12	P	79.0	62.0
Ship Bottom-Beach Arlington (Municipality)	2 driven wells, 300′-590′ deep		277	277*	31	P	23.0	19.7
Short Hills Water Co. (Pumps directly to Commonwealth Water Company's system)	2 driven wells, 80′ deep	Chlorination						
Smith Machine Co., H. B. (Smithville Section of Easthampton Twp.)	2 driven wells, 108′ deep	Aeration and filtration for iron removal	503	400	....	P	50.0	52.6

* Seasonal increase from 2 to 20 times in population.

TABLE No. 5.—DESCRIPTIVE DATA OF PUBLIC WATER SUPPLIES IN NEW JERSEY (Continued)

OWNER AND MUNICIPALITIES SUPPLIED	SOURCE OF SUPPLY	TREATMENT	Population 1930 Permanent	Population Supplied Estimated	1932 Consumption in Thousand Gals. Per Day	Gravity or Pumped	Hardness	Alkalinity
Somerville Water Co.	Raritan River	Rapid sand filtration (pressure) and chlorination						
(Raritan)			4,751	4,751	1,870	P	53.6	23.2
(Somerville)			8,255	8,255				
South Amboy (Municipality)	1 driven well, 55′ deep; springs; (3 driven wells, 234′-248′ deep, in reserve)	Chlorination	8,476	3,000	822	P	36.1	8.7
(Sayreville, Morgan Heights Section)			8,658	1,500				
(Buys water from Perth Amboy in emergency)								
South Jersey Water Supply Company (Mullica Hill)	2 driven wells, 260′ deep		1,827	1,000	68	P	46.8	270.7
South Orange (Municipality)	11 driven wells, 274′-382′ deep		13,630	13,630	1,133 (1929)	P	73.8	105.6
South River (Municipality)	2 driven wells, 150′-193′ deep; 253′ of collecting drains; 1 collecting well, 35′ deep		10,759	10,759	297	P	47.1	19.0
(East Brunswick Twp., part)			2,711	100				
Spring Lake (Municipality)	13 driven wells, 700′ deep		1,745	1,745*	380	P	32.2	35.0
(Spring Lake Heights)			1,221	1,221				
Spring Water Company (Chester)	Spring		1,453	50	25	P	37.7	62.0
Stanhope (Municipality)	2 driven wells, 54′-90′ deep		1,089	1,089	82	P	41.8	31.5
Stockton (Municipality)	2 driven wells, 160′ deep		556	556	25	P	28.5	21.6

Stonwald Park Assoc. (Mt. Olive Twp., Budd Lake Section)	3 shallow wells, 22′ deep		1,235	100*	....	P	55.8	32.0
Surf City Water Co. (Surf City)	1 driven well, 564′ deep		76	76*	10	P	34.3	18.0
Sussex (Municipality)	Lake Rutherford	Chlorination	1,415	1,415	362	G	24.1	3.3
Swackhamer, B. B. (Long Valley Section of Washington Twp.)	Springs on Schooley's Mountain		1,615	250	....	G	19.0	13.0
Swedesboro (Municipality)	5 driven wells, 138′-200′ deep	Chlorination	2,123	2,123	93	P	50.3	82.6
Thieme, Margaret (Princeton Twp.)	1 driven well, 170′ deep	Chlorination	2,738	40	....	P	115.0	103.0
Toms River Water Co.	8 driven wells, 47′-62′ deep							
(Dover Twp., Toms River Section)			3,970	2,400*	326	P	10.5	2.6
(South Toms River)			405	405				
(Berkeley Twp., part)			811	150				
Trenton (Municipality)	Delaware River	Rapid sand filtration (gravity) and chlorination	123,356	123,356	15,516	P	41.5	19.2
(Ewing Twp., part)			6,942	3,500				
(Hamilton Twp., part)			27,121	8,000				
(Lawrence Twp., part)			6,298	1,000				

Tuckerton Railroad Co. (Whitings Section of Manchester Twp.)	1 driven well, 148′ deep		1,009	25	....	P	14.3	12.5
Tuckerton Water Co. (Tuckerton)	1 driven well, 190′ deep		1,429	1,429*	99	P	29.9	25.0
Union Beach (Municipality)	2 driven wells, 300′ deep	Aeration and sand filtration (pressure) for iron removal	1,893	1,893*	69	P	39.0	17.8
(Raritan Twp., part)			1,568	500				
Vanderbeck, Charles R. (Fairlawn, part)	1 driven well, 150′ deep		5,990	900	....	P	84.7	50.5
Ventnor (Municipality)	6 driven wells, 800′-825′ deep		6,674	6,674*	1,172	P	30.0	53.6
Vincentown Water Co. (Vincentown Section of Mt. Holly Twp.)	1 driven well, 150′ deep (emergency supply, Branch of Rancocas Creek)	Chlorination of emergency supply	6,573	700	17	P	66.1	72.5
Vineland (Municipality)	13 driven wells, 120′-136′ deep		7,556	7,556	966	P	16.9	3.0
(Landis Twp., part)			14,047	3,000				
Waldwick (Municipality)	3 driven wells, 275′-300′ deep		1,728	1,728	88	P	100.6	81.5
(Hohokus, Northern Section)			3,536	150				
(Saddle River, part)			657	50				
Wallington (Municipality)	5 driven wells, 275′-500′ deep	Chlorination	9,063	9,063	332	P	152.1	88.8
Wanaque (Municipality)	Purchases water from Pompton Lakes							
Washington Water Co. (Washington)	Roaring Rock Brook	Chlorination	4,410	4,410	355	G	24.7	12.8
Weinberg, Regina H. (Pennsville)	1 driven well, 35′ deep		2,933	80	8	P	70.0	8.0
(Lower Penns Neck Twp.)								
Wenonah (Municipality)	8 driven wells, 210′-250′ deep		1,245	1,245	93	P	30.8	128.6
West Jersey Water Service, Inc. (Budd Lake Section of Mt. Olive Twp.)	1 driven well, 100′ deep	Chlorination	1,235	50*	6	P	39.0	32.0
Westville (Municipality)	5 driven wells, 112′-117′ deep		3,462	3,462	148	P	59.3	75.0
(Deptford Twp., part)			4,507	2,000				
(West Deptford Twp., part)			3,956	600				
Wharton (Municipality)	Rockaway River above Stevens Brook	Rapid sand filtration (pressure) and chlorination	3,683	3,683	94	P	34.1	20.4
Whippany Water Co. (Hanover Twp.)	Purchases water from Morristown (formerly supply of Normandy Water Company)		2,516	1,000	....	P	20.8	162.0
White Horse Water Company (White Horse Section of Hamilton Twp.)	Purchases water from City of Bordentown		27,121	250				
Wildwood (Municipality)	32 driven wells, 50′-1000′ deep (emergency plants at Wildwood and North Wildwood)	Chlorination, part	5,366	5,330*	1,626	P	52.9	56.5
(North Wildwood)			2,049	2,049*				
(West Wildwood)			178	178*				
(Wildwood Crest)			738	738*				
(Middle Twp., part)			3,430	40				
Winters, Albert (Hohokus Twp., Mahwah Section)	Spring		3,536	100	....	G	94.3	71.0
Woodbine Light, Power and Water Co. (Woodbine)	5 driven wells, 150′-160′ deep		2,164	2,164	92	P	26.6	3.5
Woodbury (Municipality)	10 driven wells, 287′-293′ deep at Sewell, N. J.	Chlorination and ammoniation	8,172	8,172	639	P	28.4	144.0
(Woodbury Heights)			997	997				
(Deptford Twp., part)			4,507	50				
Woodstown (Municipality)	7 driven wells, 165′-711′ deep		1,832	1,832	83	P	48.0	192.8

* Seasonal increase from 2 to 20 times in population.

The following table No. 6 lists the municipal sewage treatment plants operating at the end of the fiscal year, June 30, 1933:

TABLE No. 6—MUNICIPAL SEWAGE TREATMENT PLANTS IN NEW JERSEY

LOCATION	OWNERSHIP, MUNICIPALITY OR COMPANY	COUNTY OF LOCATION OF PLANT	MUNICIPALITIES OR LOCATIONS SERVED	Permanent Population, 1930 Census	Estimated Population Served
Allenhurst	Borough	Monmouth	Allenhurst	573*	573*
Asbury Park	City	Monmouth	Asbury Park	14,981*	14,981*
Atlantic City	City	Atlantic	Chelsea Heights Section	66,198*	758*

Report of the Bureau of Food and Drugs

For the Year Ending June 30, 1933

W. W. Scofield, Chief

The enforcement of Chapter 131 of the Laws of 1932, the act fixing minimum requirements for the production, handling, importation and distribution of milk, cream and milk products in New Jersey, required a large proportion of the work of this Bureau during the past year. The act provided that this Department was to be satisfied that the sanitary requirements fixed in the law were complied with before a permit to import milk, cream or milk products was granted in the cases of those dairy farms and milk plants located in other States from which it was intended to ship milk, cream or milk products into New Jersey. In the case of those premises which were to be used in the production and handling of milk or cream to be used as such in the fluid condition, the inspections were to be made by agents of this Department or of a local board of health of this State, and in the case of premises which were to be used in the production and handling of milk to be used for manufacturing purposes, the inspections were to be made by either of these New Jersey official agencies or by the board having similar authority in the States in which the dairy farms and milk plants were located.

Applications for permits were received from one hundred and forty-five individuals or firms to ship milk, cream or milk products into this State from four hundred and twenty-seven milk plants supplied by 79,977 farmers in the States of New York, Pennsylvania, Maryland, Delaware, Virginia, West Virginia, Tennessee, Indiana, Illinois, Ohio, Missouri, Michigan, Minnesota and Wisconsin.

The enforcement of this law established the fact that fluid milk was imported into New Jersey from the States of New York, Pennsylvania, Delaware and Maryland, and that no milk for any purpose was received in this State from areas outside of the abovementioned States, although large quantities of cream were shipped into this State from Wisconsin, Michigan, Indiana, West Virginia and Virginia. It was also established that it was necessary to import cream in order to supply the demand for fluid cream and also cream for manufacturing purposes, due to the fact that a very small amount of cream is produced in this State.

Because of the extremely large number of premises outside of the State on which milk, cream or milk products were being produced or handled for final distribution in New Jersey, it became evident shortly after the law went into effect that it would be impossible for this Department to obtain reports of official inspections of all of these premises within a reasonable time, as many local boards of health of this State and certain of the States from which milk or cream was imported did not cause inspections to be made of milk plants or dairy farms. Consequently, it became apparent that an extreme shortage of milk and cream would result in this State if the provisions of the act were rigidly enforced and permits were refused because of the lack of information regarding compliance with the requirements of the law. The Milk Committee of this Department carefully considered this situation and the Department of Health of this State adopted the following declaration of policy at the meeting of September 13, 1932:

1. The intent of the act is to assure not only a safe supply of milk, cream and milk products but a better supply in respect to cleanliness. It is essentially a preventive measure enumerating the specific requirements which are generally recognized as essential to the output of a wholesome product. Changes in methods and equipment, especially improvements which are expensive, should be made gradually with due consideration of the evident desire of speedy compliance with the law.

The Department invites the cooperation of producers, distributors and consumers alike in attaining these desired ends. In particular, we request local boards of health which maintain their own inspection service to cooperate with our own staff and with each other to secure greater uniformity in standards and to avoid unnecessary duplication of inspection.

2. Permits for the importation of milk, cream and/or milk products shall be granted upon evidence satisfactory to this Department that the supply meets the minimum requirements of the law. Such evidence shall be furnished by inspections of dairies, milk plants and methods of handling by the State Department of Health, by local boards of health or other official authorities approved by this Department.

Pending complete inspection, temporary permits may be granted to persons or corporations of good repute for the importation of milk, cream and/or milk products, provided that any part or all of the supply may be excluded, or the permit revoked without hearing, whenever, upon evidence secured by inspection or by examination of products offered for sale, it shall appear that such holders of temporary permits are not complying with the law or making reasonable efforts to do so.

3. The necessity of giving particular attention to the sanitary character of fluid milk and cream imposes a heavy burden upon the staff and resources of the Department. Until the staff shall be increased and sufficient funds provided for traveling expenses and maintenance in the field, the territory for inspection must be limited to accessible portions of adjacent States—New York, Pennsylvania, Maryland and Delaware. Inspections made by local boards of health of this State or other approved governmental authorities should be checked from time to time by our own staff in order to secure greater uniformity in standards. A "cross-section" inspection of approximately ten per cent. of the dairies selected at random from those supplying any milk or cream plant shall be termed a sufficient test of the standing of such plant, and if conditions are found to be unsatisfactory the entire output of such plant shall be excluded from shipment into this State.

4. Applications for reinstatement, following the revocation or the refusal of a permit or the exclusion of any part or all of the output of any milk or cream plant, shall be made as in the first instance and granted only on evidence supplied by inspection or from other tests satisfactory to this Department. Inspection incident to the reinstatement of permits which have been revoked for violation of the sanitary provisions of law should not take precedence over regular duties of the staff.

5. In case of emergency arising from any cause which in the judgment of this Department may endanger the public health, special permits for the importation of milk, cream and/or milk products may be granted for limited periods and for restricted areas without prejudice to the standing of other permits which may be temporarily suspended. Such special permit may be granted forthwith on evidence satisfactory to this Department that the proposed supply is sanitarily safe, provided that as speedily as possible thereafter the customary inspections be made by the Department or its approved representatives.

6. Present laws set up higher standards than heretofore for milk and cream produced and offered for sale within the State, but made no provisions for their enforcement except on the remedial basis. Preventive treatment is no less important at home than abroad. Gradually and as rapidly as possible our local producers and distributors must be educated to better methods and those who are unwilling or unable to comply with the minimum requirements of the law should be eliminated. This can be done only upon inspection by own staff and/or by local boards of health. It is imperative, therefore, that there should be

closer cooperation than heretofore between the State Department and local boards. By more frequent conference of inspectors and by regular inter-change of information concerning official action a more uniform system of administration may be secured and excessive duplication of inspection avoided.

Numerous conferences were held during July, August and September of 1932 between the Milk Committee of this Department and representatives of local boards of health, agricultural officials, milk producers and distributors. These conferences were called for the purpose of securing the active cooperation of all interested persons in carrying into effect the provisions of this act with a minimum amount of duplication of effort and with uniformity of interpretation. Local boards of health of the State were requested to send copies of reports of inspections of dairy farms and milk plants located in other States to us in order that permits to import milk, cream or milk products might be granted as rapidly as possible. The Milk Committee of this Department secured authorization from the Governor to send agents of this Bureau into other States to make inspections of dairy farms and milk plants. The agents of this Department were detailed to make inspections of those supplies which were not inspected by local boards of health of this State. In making these investigations, our agents were instructed to enter premises in States other than New Jersey only after permission had been granted by the person in charge and inspections were then to be made without giving orders to the person to make changes in the equipment or methods of operation of the dairy farm or milk plant.

Affidavits were taken by officials of certain milk companies and of certain boards in other States that all of the dairy farms and milk plants in certain milk supplies were operated in conformity with the requirements of this law. Shortly after certain of these sworn statements were received, indisputable proof was also received that the statements were false and that those persons had deliberately sworn to falsehoods for the purpose of securing permits. Where the Milk Committee was able to prove that false statements had been submitted, the applications for permits were rejected or the temporary permits were revoked. The fact that the submission of false statements was likely to result in failure to obtain the desired permit soon spread and sworn statements

received during the late fall and winter were generally carefully drawn with exceptions noted of those requirements of the law which had not been met.

Rapid progress was made during the summer and fall of 1932 in the enforcement of the act as certain boards of health of this State forwarded reports of inspections made of milk supplies in New York and Pennsylvania and of cream supplies in Indiana, Ohio, Michigan and Wisconsin.

As the enforcement of the law proceeded, it became evident that several of the firms obtaining cream in the mid-western States were very anxious to hold the permits granted to them because of their unusual activity in compelling the dairymen to make the changes necessary to comply with the provisions of the New Jersey law. In certain cases, forces of men with concrete mixing machines or forces of carpenters were employed by the firms and were ordered to install concrete floors in cow stables or to build milk houses on those premises not so equipped.

The Milk Committee of the Department decided in the early winter to concentrate inspection on the dairy premises in New Jersey. In carrying out this work, the Milk Committee took the position outlined in the act that the attention of local boards of health of those municipalities in which the milk was distributed was to be called to their failure to enforce the provisions of the act.

Inspections were made of certain of the milk supplies in New Jersey and it was gratifying to learn of the fine spirit of compliance on the part of dairymen and milk plant operators in complying with the provisions of the act.

In those cases where dairy farms did not meet the requirements, the matter was directed to the boards of health of the municipalities where the milk was distributed, in cases where the local boards of health had not filed resolutions of their inability to enforce the law (as specified in the law), and in those cases where such resolutions had been received, the dairymen were notified regarding the requirements which were not complied with in communications from this Department. Reinspections of certain of these supplies showed substantial compliance with the law.

In general, inspections made of dairy farms and milk plants in New Jersey showed that the requirements of this law placed little

hardship upon the operators of dairy farms and milk plants, with the exception of dairy farms located in certain sections of the State. This is attributed to inspections made and to educational advice given to dairymen and milk plant operators over a long period of years by agents of this Department.

The Department granted 137 permits to ship milk, cream or milk products into New Jersey from 319 milk plants which were supplied by 35,708 dairymen. Fourteen of the permits have been revoked because of violation of the requirements as contained in the act.

Physical Examinations of Dairy Cows—Under the provisions of Chapter 131 of the Laws of 1932, the reports of the annual physical examinations of the animals in herds used for the production of milk or cream intended for sale in this State are required to be filed at the milk plant to which the milk is delivered. These reports are being checked by the agents of this Department as inspections are made of the milk plants.

Physical Examinations of Employees of Milk Plants—Chapter 131 of the Laws of 1932 requires employees to be examined by a licensed physician at least annually and to submit such specimens of bodily discharges as the State or local board of health may require. The value of the laboratory examinations of bodily discharges from milk plant employees is probably equal to or greater than the physical examinations of such persons. Because of the practical difficulty in the cost of such laboratory examinations made in private laboratories, and because of the few laboratories equipped to conduct such examinations, this Department has not attempted to enforce this provision of the law during the year, but decided to postpone this work until the enlargement of the laboratory of this Department was completed. It is hoped that the laboratory of this Department will be in a position to offer to make these examinations for the employees of milk plants without cost to them during the coming year.

Collection of Milk, Cream and Milk Products—During the year 5,131 samples of milk and cream collected by the agents of the Bureau were examined chemically. None of these samples con-

tained preservatives and a very small number of samples of milk had been adulterated with water. A small percentage of the samples collected failed to meet the legal standards for total solids or milk fat.

Non-Alcoholic Beverage and Bottled Water Plant Inspection—During the year 495 inspections were made of beverage and water bottling plants in this State and 91 samples of non-alcoholic beverages and bottled water were collected. In general, the plants were found to be operated under sanitary conditions. Emphasis has been placed upon the necessity of cleansing bottles and utensils thoroughly. Prosecutions have been ordered by the Department in cases where beverages were misbranded by statements on labels or caps that the beverages were prepared from fruit flavorings when in fact imitation flavorings had been used.

A careful inspection was made of each plant at which water was bottled for sale to determine whether or not the source of the water was protected adequately from contamination and also whether or not the methods employed in bottling the water were in accordance with the requirements of this State. Samples of each bottled water were collected and examined in the laboratory of this Department. Permits were granted only to those establishments which were operated in strict conformity with the requirements and in cases where the water was found to be free from contamination.

Slaughter-House Inspection—During the year 188 inspections have been made of slaughter-houses. These establishments were found to be operated in substantial compliance with the laws of this State.

During these investigations 543 beef carcasses, 413 calf carcasses and 134 hog carcasses were inspected and passed for food; 2 beef carcasses and 872 pounds of beef were condemned as unfit for food.

Report of the Bureau of Bacteriology

For the Year Ending June 30, 1933

J. V. MULCAHY, CHIEF

The work of the Bureau of Bacteriology during the fiscal year ending June 30, 1933, has greatly increased over previous years, which shows that the physicians of the State appreciate the facilities of the laboratory and are submitting an increasing number of specimens to aid them in their diagnosis of suspected cases of communicable diseases.

The following table shows the number of specimens from various cases of communicable diseases examined during the last fiscal year, making a total number of specimens examined of 73,339.

TABLE I

Total Number of Specimens Examined During Fiscal Year Ending June 30, 1933

Diphtheria	7,256
Tuberculosis	7,615
Typhoid fever	3,095
Typhoid bacilli (feces and urine)	4,036
Gonorrhoea	5,783
Syphilis	41,560
Miscellaneous specimens	3,994
Total	73,339

A comparison of this table with a similar table in last year's report shows an increase of 4,244 specimens. The number of specimens received for diphtheria examinations however is almost a thousand specimens less than last year. The examination of specimens from suspected cases of diphtheria is decreasing yearly and is a fine commentary on the efficacy of the diphtheria im-

munization that has been and is being carried on through the efforts of State and local health officials throughout the State.

It will be seen that 7,256 specimens were examined for the presence of diphtheria bacilli, many of these being taken from well persons on dairy premises, from new inmates in State institutions and from food handlers in camps and other groups to detect and control diphtheria carriers.

The largest increase in the number of specimens received and examined during the year was in the number of specimens of blood received for the Wassermann test. This test is being increasingly depended upon by physicians to assist them in the early diagnosis of cases of syphilis and also to eliminate the possibility of this disease being responsible for obscure cases of illness seen by the physician. Many other specimens of blood for syphilis are received to determine and follow the results of specific treatment for this disease so that the physician may be assured that sufficient treatment has been given.

Previous to June 15th of this year this work was done in a very small room under adverse working conditions. Due to the efforts of our Board and the generosity of the State House Commission it has been possible to equip a larger room for these examinations. This room is well adapted to carry on this work and the only thing that will prevent taking care of increased demands for this examination is lack of technical assistants.

This work is largely carried on by four technical workers and the preparation of over 41,500 blood specimens for examination and the examination of these specimens by the complicated test represents about the maximum number that can be handled by this force. To provide for the yearly increase in the number of these specimens and the increased demands from industrial plants and State institutions for Wassermann tests will require at least two additional technicians to assist with these examinations.

Kahn tests are also now done on all positive Wassermann specimens. This check on the results of the Wassermann test by running duplicate tests by the Kahn test we feel gives the physician additional information upon which to base his diagnosis, especially in obscure cases of illness that may not present any physical evidence of syphilis.

During the latter part of the year we have been occupying our new rooms. The three rooms assigned to the Bureau of Bacteriology have been equipped and provide the additional space that has been much needed for several years. The new rooms are well lighted and the arrangement well adapted to facilitate handling the specimens for examination.

One room, as stated above, is devoted to the examination of blood specimens for syphilis. A larger room is used for the microscopical and cultural examination of specimens from suspected cases of communicable diseases. The third room is used for plating out feces and urine specimens from suspected and convalescent cases of typhoid fever and specimens from dairy employees and other food handlers to detect typhoid carriers.

We are much pleased with the equipment of these rooms. Ample bench and drawer space has been provided and the electrical, gas and water outlets are conveniently located for each technical worker.

TABLE II

Yearly Totals of Animals Examined for Rabies from 1924 to 1933, Inclusive

	1924	1925	1926	1927	1928	1929	1930	1931	1932	1933
Positive	125	160	202	164	93	106	96	80	177	130
Negative	79	116	145	132	116	115	121	114	123	121
Unsatisfactory..	23	18	25	26	19	22	11	8	27	21
Total	226	294	372	322	228	243	228	202	327	272

As will be seen from Table II the number of rabid dogs as determined by examinations made in this laboratory continues high, although less in number than the number found rabid in this laboratory during the previous year. This does not, however, give a true picture of the prevalence of this disease in this State, as many cases of rabies have occurred in the northern section of the State that are examined in municipal and county laboratories in that section of the State.

It will be seen from the table that 21 specimens were received unfit for examination, due to neglect to ice the animal's head when forwarding to the laboratory by express. When a person has

been bitten by a suspected rabid animal, delay due to shipment by express or spoilage of specimen in transit, may delay the treatment of the individual bitten. Unnecessary delay in the treatment of persons bitten by a rabid animal is to be avoided and the head of the animal should be brought promptly by messenger to the laboratory for examination. These specimens are examined upon the receipt of the specimen and a report can usually be given within an hour of its arrival.

Time consuming examinations have been made on various food products causing illness during the pase year. Cases of illness with nausea, vomiting and diarrhea due to a batch of ice cream required extensive cultural and animal tests to determine the organisms responsible for the toxic products in this particular batch of ice cream.

Under unusual examinations may be listed such tests as foods of various kinds that have caused human sickness or are suspected to have caused sickness during this year; such as raw sausage, meat, cakes, eclairs, cream puffs, ice cream, etc. These examinations involve considerable time and work, as well as the use of a number of animals.

One of the most interesting cases, in spite of the continued publicity given out by the Department against the consumption of raw pork products, occurred in a family in Atlantic City in March. The suspected specimen was a sample of uncooked sausage prepared with spices and the raw pork from a hog raised and slaughtered by the household. The laboratory used the parafin method of embedding, slicing and staining, and obtained a number of excellent slides showing the encysted trichina in great numbers in the muscle tissue. Such a heavily infected article of food would prove most dangerous to anyone so unfortunate as to consume it, resulting in severe sickness and sometimes death.

It will be seen from Table XII that 306 specimens were received during the year for evidence of B. abortus infection, and that 48 of these specimens gave a positive agglutination test on specimens of human blood for undulant fever.

The symptoms of this disease are so varied, indefinite and suggestive of many other diseases, particularly of typhoid fever,

malaria, tuberculosis and influenza that the physician is perhaps more dependent upon laboratory examination for the diagnosis of undulant fever than for any other disease.

Undulant fever is an infectious disease due to an infection with organisms of the abortus melitensis group transmitted by infected cows, goats, swine and possibly other animals. The chief source of infection is usually raw milk from infected cows and goats, but other cases have been found to be due to contact with infected animals either at the time of slaughtering or with discharges during parturition.

The laboratory diagnosis of undulant fever is made by the examination of the blood for agglutinating properties and this method has proven a valuable aid in the diagnosis of this disease. This is the most practical test but may be supplemented by cultivation of the organism from the blood stream. Special medium will be supplied upon request for the collection of blood for culture.

For the agglutination test a specimen of blood collected in the same manner as for a Wassermann test is necessary. Dried blood on paper or aluminum foil is not satisfactory for this examination.

A reaction obtained on a specimen of blood in a dilution of 1-80 or higher is evidence that the patient has undulant fever or has had such an infection in the past. It has been found, however, that occasionally a reaction will not be obtained in some cases of undulant fever though a blood culture may show evidence of infection.

During the year additional blood from recovered cases of poliomyelitis was collected and tests made on each lot by means of the Wassermann test before pooling the different lots. At the present time a large supply of this serum is on hand for distribution for the treatment of any cases of poliomyelitis that may occur during this year.

Smallpox vaccine virus, Schick test material, diphtheria toxoid and toxin-antitoxin, typhoid bacterin, scarlet fever toxin for Dick test and tetanus antitoxin are always carried in stock and supplied to physicians and health officials at a low cost.

For the use of the Bureau of Engineering and the Bureau of Chemistry in the examination of water supplies and swimming pool examinations, thousands of tubes of culture media have been prepared together with water collecting bottles and culture dishes.

This work has kept the media force unusually busy with their other duties of preparing mailing cases for the collection of specimens for the use of physicians sending specimens from suspected cases of communicable diseases. These outfits are supplied to various repositories in all sections of the State for the convenience and use of physicians in their communities. These outfits are in some cases sent direct to the physicians who send many specimens to the laboratory.

The type of these special mailing cases is specified by the postal authorities and when the specimens sent in by the physicians are contained in the mailing cases supplied by the laboratory they are allowed in the mails with first class matter. Table XV shows that 78,912 of these outfits were assembled and shipped out for transmitting specimens for examination. These outfits after use are sterilized and reassembled for distribution.

The tabulations that follow show the various examinations made and the number of specimens examined in the laboratory, arranged and classified under the name of the disease for which they were examined.

Table XI shows the miscellaneous examinations made during the year and includes a large variety of specimens from many disease conditions.

Malaria mailing vases		284
Feces and urine mailing cases		5,112
Syphilis mailing cases		43,601
Ophthalmia neonatorum cases		61
Total		81,477

Report of the Bureau of Chemistry

For the Year Ending June 30, 1933

J. E. Bacon, Chief

Samples of foods, drugs, water, sewage and trade wastes collected by the Department's representatives in the enforcement of the Public Health Laws are examined by the Bureau of Chemistry. The facilities of the laboratory are also extended to local boards of health, State Department of Public Instruction, State Purchasing Agent, New Jersey State Police, State Department of Institutions and Agencies, State Board of Pharmacy and the Fish and Game Commission. Analyses are made of various samples of food and supplies purchased under specifications for institutional use, drugs collected by the inspectors of the State Board of Pharmacy, rural school waters submitted by local boards of education, water supplies from camps maintained by benevolent associations and other miscellaneous samples.

In addition this Bureau has supervision over the Department's laboratory boat "Inspector," which is used for field investigations in connection with the sanitary control of the shellfish industry. In cooperation with local health authorities condemned waters are patrolled and frequently opened to permit transplantal of shellfish.

There was an increase of 57.5 per cent. in the number of samples analyzed in the water laboratory and the increased work was handled by shifting the personnel between the two laboratories, by 200 man days overtime and by the employment of a temporary man for a period of three months. It is contemplated there will be a further expansion in the work of this Bureau as the alterations to the chemical laboratory recently completed provide additional space and facilities to meet the increasing

demands from the different Bureaus of the Department. The need for an additional full time chemist is apparent.

Over 18,000 samples of food, drugs, water, shellfish and miscellaneous preparations have been examined during the past year. The tabulations indicate the variety of products analyzed.

TABLE SHOWING NUMBER AND CHARACTER OF SAMPLES EXAMINED IN THE FOOD AND DRUG LABORATORY DURING THE FISCAL YEAR ENDING JUNE 30, 1933

The marked improvement in the bacterial quality of the condemned waters of Sandy Hook Bay when investigated in the summer of 1931 warranted a resurvey last summer. This was done during July and August in cooperation with the United States Public Health Service as the New Jersey shellfish shipper's certificates of all persons doing interstate business must be approved by that Department.

As past investigations indicated these waters became progressively more polluted toward the State line and the Atlantic Ocean, the logical explanation for the improvement in the bacterial quality of these waters is the nearly completed two-mile long jetty being constructed at Rockaway Point, Long Island. This would have a tendency to increase the velocity of flow in the channels, thereby causing the New York and Passaic Valley sewage to be carried further out in the ocean on the ebb tide with a greater dilution when returned to Sandy Hook Bay on the flood tide.

The following tabulation gives a comparison of results of analyses of samples of water collected from the outer area of Sandy Hook Bay obtained during past investigations and shows the improvement in bacterial quality of these waters

Date	*Number collected*	*Number showing B. Coli percentage* 1.0 cc.	0.1 cc.	0.01 cc.	
July, 1928	240	222=93 %	163=68 %	55=30 %	(180 planted)
July, 1931	280	166=59.3%	45=16 %	8= 4 %	(200 planted)
July-August, 1932	448	108=24.1%	30= 6.7%	4= 0.9%	

In view of these results the Department modified its condemnation order affecting outer Sandy Hook Bay to permit the gathering of shellfish from those portions of Raritan and Sandy Hook Bay designated as follows:

> The area bounded by a line drawn in a northerly direction from Point Comfort Beacon through channel buoy N 6 to the State line, and thence along the State line in a northeasterly direction to a point where said State line is intersected by a line drawn from Sandy Hook Point in a northwesterly direction through channel buoy N 24, excluding however,

all foreshores one-quarter mile from the mainland between Point Comfort and Highlands, New Jersey, also excluding the area bounded by a half circle having a radius of one mile from the Atlantic Highlands steamboat pier.

Following are tabulations of results of bacteriological analyses of samples from other parts of Sandy Hook Bay:

APPROVED WATERS, "INNER AREA"

Number of samples collected	320
Number showing B. coli in 1.0 cc.	11= 3.4%
Number showing B. coli in 0.1 cc.	2= 0.6%
Number showing B. coli in 0.01 cc.	0

APPROVED WATERS, "HIGHLANDS AREA"

Number of samples collected	55
Number showing B. coli in 1.0 cc.	11=20 %
Number showing B. coli in 0.1 cc.	3= 5.5%
Number showing B. coli in 0.01 cc.	0

Representatives of the United States Public Health Service obtained confiscated tanks, piping, pumps and other equipment from the Federal prohibition authorities and an experimental set up for the purification of soft clams was installed at Highlands, New Jersey. In cooperation with the Public Health Service experimental runs were conducted, whereby soft clams were placed in tanks ashore and allowed to drink river water, purified by chlorination, for varying periods of time. The results of the investigation, while encouraging, were not such that this method of treatment could be advocated with the assurance that high scores of the shucked clams would be eliminated. It is possible that changes in the mechanical set up might solve the problem.

The shellfish supervision at Bivalve and Maurice River has been carried on as in the past, in that a major portion of the time during the oyster season the Department's boat was located in these waters and the personnel were occupied in making bacteriological examinations of shellfish and the waters of Maurice River and Maurice River Cove. Considerable time was spent by the bacteriologist in checking up on sanitary conditions existing in the

shucking houses and in the settlement at Shellpile, where most of the colored population reside. Under the direction of the Oyster Growers and Dealers Association a clinic for the treatment of venereal disease was established at Port Norris, New Jersey.

Following are tabulations of bacteriological results obtained on water and oyster samples taken from various shellfish areas of the State:

SCORES OF SALT OYSTERS TAKEN FROM DELAWARE BAY

Number of samples collected	40
Number scoring 0	24=60 %

Report of the Bureau of Child Hygiene

For the Calendar Year 1932

JULIUS LEVY, M. D., CONSULTANT

INFANT MORTALITY

We are very happy to be able to report for 1932 for New Jersey the lowest infant mortality that has ever been reported for the State. This rate for 1932 was 50, six points lower than the 1931 rate and the lowest in the history of the State. In the presence of the serious depression, this is naturally a source of great gratification.

The highest infant mortality rate for any county was 84. Only 3 had a rate over 70 and 8 with a rate less than 50.

Salem County had the highest rate, 84. Cape May was lowest with 36. These are sparsely populated counties and two or three deaths would make considerable difference in their rates. Low rates for the larger counties were found in Bergen and Essex, 40 and 41 respectively.

Among the largest cities in the State, those with more than 1,000 births, Newark had the lowest rate 44 and Camden City had the highest rate 72.

Among the cities with a population between 50,000 and 100,000, Irvington had the lowest rate, 35 and Atlantic City was again high with 89.

West New York with a rate of 17 was again low among the cities with a population between 25,000 and 50,000. Perth Amboy with a rate of 74 was high.

The lowest rate for cities with a population between 10,000 and 25,000 was 22 for Cliffside Park. Pleasantville had the highest rate, 91.

A comparison with neighboring States places New Jersey at the head of the list with the lowest infant mortality rate among the eastern States.

New Jersey	50	Pennsylvania	59
Connecticut	50.9	Vermont	62.9
New York	52.8	Maine	63.5
Massachusetts	53.1	Delaware	68.5
Rhode Island	57.3	Maryland	69.5
New Hampshire	58.6		

Recent surveys and our own experience seem to justify the view point that the health and lives of infants depend, above all things, upon the efficiency of the mothers. The educational work that has been carried on for the past 15 years has undoubtedly contributed very largely to this final result in the State of New Jersey.

Maternal Mortality

The maternal mortality rate 5.7 shows a slight decrease over 1931. However, the maternal rate varies but little from year to year.

Neo-Natal Mortality

A slight decrease has occurred in the deaths under one month as well as the stillbirth rate. Twenty-nine, the neo-natal rate, was the lowest in the history of the State. The stillbirth rate of 38 was the same as 1930.

Statistical Summary

The following rates are per 1,000 live births for the State:

Deaths under one year	50
Deaths under one month	29
Stillbirths	38
Puerperal deaths	5.7

One hundred and forty-eight nurses supervised 9,997 expectant mothers, 24,588 babies, 24,969 preschool children and 127,727 school children.

16 nurses were paid by the State Department of Health
116 nurses were paid by the local communities
16 nurses were paid partly by the State and partly by the community in which they worked.

Four hundred and eighty-one communities carried on the State Child Hygiene Program under State supervision.

One hundred and fifty baby keep-well stations were conducted weekly where mothers could take their babies and preschool children.

Nine district supervisors supervised 362 of the midwives of the State.

Three communities assumed part of the salary of the nurse during the year. The State re-assumed the salary of one nurse and part of the salary of another due to financial difficulties in their communities.

There were 61,215 births in 1932, a 4 per cent. drop in the number of births.

Visits made by nurses			329,716
To expectant mothers		28,740	
To babies		133,531	
To preschool children		106,139	
To school children		61,306	
Visits to Baby Keep-well Stations			109,067
By babies		82,189	
By preschool children		26,878	
Prenatal Advice (expectant mother)—			
Supervised prenatal cases			9,997
Address changed before delivery		303	
Pregnancies ended		4,207	
Live births	4,090		
Stillbirths	75		
Miscarriages	42		
Maternal deaths	18		
Attendants at births—			
Doctor or hospital			3,497
Midwife			693
No attendant			17
Infant care—			
Babies supervised			24,588
Preschool care—			
Children supervised			24,969
New cases		11,543	
Illnesses and defects (not including school child)—			
Detected		7,068	
Corrected		4,358	
Contagious diseases—			
Suspected cases discovered		1,850	

Unsanitary conditions discovered	657
Eye smears taken	32
Suspected tuberculosis cases referred	750
Assisted with:	
Toxin Anti-toxin (not including school child)	4,324
Vaccinations	529
Attendance at Little Mother League	148
Unreported births discovered	41

School children supervised		127,727
Inspections (general, classroom, annual, assisting doctor or nurses alone)		1,238,285
Defects detected	125,544	
Defects corrected	47,587	
Illnesses detected	3,674	
Illnesses corrected	2,341	
Pupils excluded	14,721	
Assisted with:		
Nose and throat cultures for diphtheria		394
Toxin Anti-toxin		6,134

Extension and Retention of Child Hygiene Work

On account of the serious financial condition in which many communities have found themselves during the past two years, it was naturally expected that a certain number would find it impossible to continue the salaries of Child Hygiene nurses and for any new communities to take over such salaries after demonstration.

We are able to report that on July 1, 1933, there are 357 communities paying salaries of Child Hygiene nurses. While some assistance was requested during the year, all but one of the communities so assisted, have managed to re-assume the salaries of the Child Hygiene nurses for the coming year.

There are now 146 Child Hygiene nurses under the supervision of the Bureau of Child Hygiene. This is only one less than in July, 1932. Of this total, 10 are paid entirely by the State, 118 by the community and 18 partly by the State and partly by the community. This result can be ascribed very largely to the thorough and devoted work of the field staff. The contribution in salaries for Child Hygiene work by local communities represents about $210,000 a year.

Conferences

During the past year, conferences were seriously curtailed in order to effect necessary economies. Instead of holding State conferences, the Department held only regional conferences. There were two regional conferences for nurses and one for midwives.

In addition to taking up the usual Child Hygiene problems in the care and management of infants and children, special emphasis was placed upon the problems that are now coming up under the general title of mental hygiene. The staff of 146 nurses has a great opportunity to bring to the mothers a better understanding of their own and their children's problems from a psychiatric view point and it is our hope, through discussion and instruction, to enable the nurses to carry on this work in addition to the usual Child Hygiene work.

Ophthalmia

There has been a marked decrease in the number of cases of ophthalmia neonatorum. This is clearly evidenced by the fact that 148 Child Hygiene nurses, who in the course of the year visited some 25,000 infants, found only five cases of positive ophthalmia neonatorum. The increase in hospitalization, the application of silver nitrate by midwives and general improvement in hygiene and sanitation have undoubtedly contributed to the result.

It appears that ophthalmia neonatorum, as a cause of blindness, will be practically eliminated from New Jersey. In past years, it has been held that as much as 70 per cent. of blindness was due to this one cause alone.

Audiometer

Late in 1932, the Department purchased an audiometer for use in the schools that were co-operating with our Bureau. An arrangement was made to rent the audiometer to boards of education at the rate of $5.00 a day. The proper carrying out of this delicate test for the detection of defective hearing requires care-

ful supervision. The work was done under the direction of the district supervisor with the assistance of the local nurse. Up to date, this instrument has been used in all the counties in which the Child Hygiene supervision is carried on and has been applied to some 25,600 children.

Many serious cases of defective hearing have been discovered that have been previously overlooked. As a result, many conditions that contributed to the defective hearing have been corrected and children, who were presenting serious problems in scholarship and behavior, have been given an opportunity for normal development.

During the coming year, it is proposed to make this audiometer available to all the schools on the same rental basis. By this method, the State Department of Health has made available an important instrument without cost to the State.

Boarding Homes for Children

The licensing of boarding homes in New Jersey has passed through several stages. Prior to 1915, no homes were licensed, then a few municipalities passed ordinances.

In 1918, the State Department of Health passed a general ordinance requiring all homes to be licensed. An amendment was added in 1930 to have this ordinance conform more to the general formula of the State Sanitary Code requiring homes to be licensed by local health officers.

During the past year, there have been a number of conferences with the representatives of the Department of Institutions and Agencies and the State Board of Children's Guardians to effect a plan of cooperation that would enable the health officers to carry out the provisions of the ordinance in close cooperation with the State Board of Children's Guardians. A plan for cooperation was submitted to the State health officers, which after careful consideration by a special committee, was approved.

On account of certain questions of practice in carrying out the plan of cooperation, it has been suggested that the plan of cooperation be tried first in one or two communities and, as a result of that experience, the plan be put in practice for the entire State.

Toxin Anti-Toxin

The Child Hygiene nurses have cooperated with the local health departments, the State Health Department and private physicians with the immunization of children. Great progress has been made in having infants under two years of age immunized. It is generally conceded that this is the group where immunization will yield the best results.

Relief Problems

Probably no group of workers in the State have been more conscious of the great problems that have confronted families, on account of the depression, than the Child Hygiene nurses. Their daily contact with families, in which there are infants and young children, has made them keenly aware of the urgent need for relief and has enabled them to assist thousands of families by cooperating with the various relief agencies. In many counties the nurses have been acting as field agents and as investigators for local agencies.

During this past year, the nurses have been instructed to place particular emphasis upon helping the mothers in the careful selections of food stuffs and their proper preparation. In this way, even though the relief funds were very limited, we have prevented the development of malnutrition.

Midwifery

In 1932 there were 429 licensed registered midwives in the State of New Jersey. Of these 362, were under the supervision of the State Department of Health, 63 were under local supervision in Jersey City and 4 were from out of State. This was a decrease of one midwife since 1931.

Of the 362, 172 midwives, each delivered more than 12 cases a year; 133 midwives, each delivered less than 12 cases a year and 57 midwives did not deliver a single case during 1932. There was very little change in this respect.

Unlicensed Midwives

In 1932 two unlicensed midwives continued to practice after being prosecuted. They were located in rural districts where doctors or licensed midwives could not expect to make a living.

It is gratifying to find that despite trying economic conditions, no new unlicensed midwives came into existence during the year.

Number of Cases Delivered By Midwives

There was a decrease of 2,863 in the number of births for 1932. Of these 1,555 or 54 per cent. effected the cases delivered by midwives. Some of this was probably due to the fact that many midwives' patients were sent into hospitals by charity organizations.

The principal feature in regard to midwifery during the past year has been the continuous reduction of cases delivered by midwives. This fell in 1932 to 6,841 deliveries or 11 per cent. of the total.

When we started our work in 1919, midwives delivered 30,000 women or 42.2 per cent. of the total. It is interesting to note that in certain communities and counties, midwives still deliver the greater number of total births.

Garfield	34%	South River	57%
Carteret	53%	Perth Amboy	42%

Supervision

The County Midwives' Associations held 94 meetings with an attendance of 1,552 during the year. In addition the annual conference was held in two sections of the State, namely: Newark and Trenton with an attendance of over 300.

The subjects for lectures and discussions were: "The Proper Care of the Premature Baby; The Proper Care of Lacerations; Emergency Relief Problems."

Special investigations were made of 23 cases. They were: Sepsis 1, Ophthalmia 1, Stillbirths 4, Infant Deaths 15 and others 2.

The district supervisors actually attended 34 cases with midwives. These included labors and early postpartum cases.

Prosecutions

During 1932 three midwives were referred to State Board of Medical Examiners for prosecution with the following results: one case was dismissed in the local court; one case is pending and the license of the third midwife was revoked. The complaints were:

Failure to call a physician on an abnormal case	2
For conviction for criminal abortion	1

This is the best record for a number of years.

Prenatal Cases

The midwives under the supervision of the State Department of Health referred 2,297 or 33.6 of the total cases delivered by them for prenatal care. This was a slight decrease. These patients were referred to family physicians, to prenatal centres and prenatal clinics for physical examinations and prenatal care.

Abnormal Cases

Of the number of cases delivered by midwives, 479 or 7 per cent. of their total cases were reported as abnormal. Of this number, in 458 or 95.4 instances, family physicians were called in or the patients were sent to hospitals. Although the midwives delivered fewer cases in 1932, they referred a larger percentage of abnormal cases to physician or hospital. Abnormal cases reported by midwives include any deviation from the normal condition of pregnancy and labor.

Advanced Course

We have been able to conduct an Advanced Course for licensed midwives through the active cooperation of Dr. Cosgrove and the Margaret Hague Maternity Hospital, Jersey City. During

the past year, 32 midwives completed this course. This brings the total number of midwives, who have spent at least one month in the hospital for special instruction in advanced methods of midwifery, to 147.

When one considers the marked decrease in midwifery practice and the serious depression from which they suffered as acutely as any other group, all concerned can feel very proud of the fact that 147 midwives were willing to give up their time, at a considerable loss of income, to this work. This represents 40 per cent. of the total number of supervised midwives. It may be interesting to know that of this number, 36 were over 50 years of age.

It has been the custom to give certificates to midwives who completed the course but a pin of credit only to those midwives, who after one year of supervision, were found to be living up to the instructions they received in their course. One hundred and two or 70 per cent. of the midwives have received such pins of merit.

Ninth Annual Conference

Because of economic conditions, the ninth annual conference of licensed supervised midwives of New Jersey was held in two sections in 1932. The first section was held in the Nurses' Home, Newark City Hospital. Midwives from the northern part of New Jersey were invited to this session which was half-day. The second section was held at the International Institute, Trenton. Midwives from the southern part of New Jersey were invited to this half-day session.

The speakers were: Dr. Earl Snavely, Medical Director, Newark City Hospital; Dr. John F. Hagerty, President, State Medical Society; Dr. Lewis H. Loeser, Newark; Dr. S. A. Cosgrove, Medical Director, Margaret Hague Maternity Hospital, Jersey City; Miss Margaret MacNaughton, Member, State Board of Health; Dr. W. G. Schauffler, Chairman, Public Relations Committee, State Medical Society, Princeton; Dr. Hannah Beatty, Medical Director, Clinton Farms; Dr. J. Lynn Mahaffey, Director, State Department of Health.

The program was devoted to "Mental Hygiene" or "How to Prepare a Patient Mentally for Pregnancy and Labor".

Six midwives from both the northern and southern parts of New Jersey gave demonsrations on "What I Do When I Visit an Expectant Mother".

Maternity Homes

During the year 1932, 31 persons applied for licenses to conduct maternity homes. The results were:

Number of new homes licensed	2
Number of homes where license was renewed	22
Number of homes where license was rejected	3
Number of homes discontinued	1
Number of homes referred to Department of Institutions and Agencies	3

The homes were in charge of:

Graduate nurses	5
Practical nurses	24
Licensed, supervised midwives	2

There were 392 cases delivered in these maternity homes. Of these 378 were delivered by physicians and 14 were delivered by midwives. Last year 530 cases were delivered in maternity homes. Therefore, there is a large decrease this year.

UNMARRIED MOTHERS

During the year 1932, there were 1,297 reported illegitimate births. This was 2.1 per cent. of the total number of live births and a slight increase over 1931.

REPORTED ILLEGITIMATE BIRTHS FOR A FIVE-YEAR PERIOD

YEAR	Total Births	Total Illegitimate Births	Per Cent. Illegitimate Births	Illegitimate Births —Colored	Mothers Under 16 Years	Mothers 16 to 21 Years	Mothers 21 to 35 Years	Mothers Over 35 Years	Mothers' Age Not Given	REMARKS
1928.....	70,076	1,086	1.5	426 (39.2)	104	574	355	43	4	6 mothers had twins
1929.....	68,297	1,252	1.8	491 (39.2)	97	650	443	49	3	9 mothers had twins
1930.....	68,282	1,245	1.8	486 (39.)	96	681	416	45	3	4 mothers had twins
1931.....	64,078	1,260	1.9	468 (37.1)	94	676	444	41	0	3 mothers had twins 1 mother had triplets
1932.....	61,215	1,297	2.1	461 (35.8)	94	693	460	43	0	7 mothers had twins

It is interesting to note that there has not been any appreciable increase due to the depression and unemployment, while the percentage of unmarried mothers among the colored race has actually decreased.

Report of the Bureau of Venereal Disease Control

For the Year Ending June 30, 1933

WILLIAM SAMPSON, CHIEF

Probably more matters of importance affecting the control of the venereal diseases in the State of New Jersey have happened the last twelve months than in any other equivalent period since the Bureau was organized. Possibly the most important, because it has given the Bureau a solid legal background, has been the enactment of some amendments to the law enforcement law by the Legislature. These changes are treated more specifically later on.

The other matters referred to have been more subjective, dealing with the work of the personnel of the Bureau. These are discussed separately and it will not be necessary to outline them here. It is sufficient to say that the work has expanded steadily, and many of the accomplishments, or achievements, standing by themselves might even be considered spectacular.

There is more routine in connection with the treatment of patients than possibly any other phase of activity, and it is well to report upon the statistical data first.

CASES REPORTED

Number of cases of venereal disease reported to the State Department of Health, for the twelve months ending June 30, 1931, 1932, and 1933:

	1931	1932	1933
Chancroid	57	54	39
Gonorrhea	4,175	4,088	3,734
Syphilis	7,591	7,911	7,007
Total	11,823	12,053	10,780

The table below gives the reported cases in New Jersey by county, disease and sex for the calendar year of 1932, together with the yearly rate per thousand:

County	Gonorrhea M	Gonorrhea F	Syphilis M	Syphilis F	Chancroid M	Chancroid F	Total	Population	Rate Per M
Atlantic	305	25	294	220	1	0	845	133,803	6.315
Bergen	93	40	224	190	0	0	547	398,842	1.371
Burlington ..	36	2	71	67	0	0	176	96,124	1.831
Camden	203	72	293	287	2	0	857	265,879	3.223
Cape May ...	19	11	19	9	0	0	58	31,687	1.830
Cumberland .	67	17	118	98	3	0	303	71,771	4.222
Essex 1,545		267	1,628	1,420	38	3	4,901	873,338	5.612
Gloucester ...	28	6	28	23	0	0	85	75,759	1.122
Hudson	48	10	64	35	1	0	*158	704,246	.224
Hunterdon ..	22	6	30	36	2	0	96	35,133	2.732
Mercer	288	61	411	237	2	0	999	193,128	5.173
Middlesex ...	48	3	83	64	0	0	198	223,156	.887
Monmouth ..	60	31	194	191	0	2	478	156,490	3.055
Morris	52	17	30	31	0	0	130	116,536	1.116
Ocean	27	6	20	18	3	0	74	35,465	2.087
Passaic	207	76	180	181	4	0	648	311,559	2.080
Salem	32	8	51	29	2	0	122	36,892	3.307
Somerset	35	7	30	17	1	0	90	68,894	1.306
Sussex	9	1	13	4	0	0	27	28,471	.948
Union	65	16	99	104	0	1	285	328,269	.868
Warren	5	1	17	10	0	0	33	50,255	.657
Total 3,194		683	3,897	3,271	59	6	11,110	4,235,698	2.623

* Does not include cases from Hudson County Laboratory.

This contrasts with 11,786 cases for the calendar year 1931, when the annual rate per thousand was 2.840 as against 2.623 for 1932. The customary indifference to reporting cases of gonorrhea is again exhibited and this again is partially traceable to the ignorance of those infected as to the seriousness of the disease. They do not take their cases to physicians but continue to regard gonorrhea as nothing worse than a cold. It is possible that this belief may never be wholly eradicated.

CLINIC PATIENTS AND TREATMENTS FOR FISCAL YEARS 1931, 1932 AND 1933

Patients	1931	1932	1933
Syphilis	4,153	4,399	4,810
Gonorrhea	2,242	2,383	2,638
Total	6,395	6,782	7,448
Treatments			
Syphilis	108,887	161,231	187,654
Gonorrhea	27,109	35,841	49,460
Total	135,996	197,072	237,114

This shows that there has been a steady increase the last three years in the number of clinic patients, both in syphilis and in gonorrhea, in the twelve months just passed. Sixty-seven per cent. of the patients were being treated in clinics, as against 57 per cent. the preceding year. Thirty-three per cent. were private patients, as against 43 per cent. the year before, and it will be interesting to note if the trend changes when economical conditions are reversed.

ANALYSIS OF SOURCES OF INFECTION

The following table classifies the sources of infection that were reported to the State Department of Health for the fiscal years ending June 30, 1932, and June 30, 1933:

	1932	1933
Professional prostitutes and brothels	40	22
Clandestine prostitutes	229	222
Husband or wife	185	170
Congenital	136	376
Miscellaneous	...	7
Total	590	797

A supply of neoarsphenamine and bismuth subsalicylate, together with distilled water, was sent to 255 physicians in the State who furnished the names and addresses of the sources of syphilitic infections.

Action Taken on Suspected Sources

During the past fiscal year 205 cases of persons reported as being the probable sources of infection have been referred to local health executives for investigation as contrasted with 231 the preceding year. There is appended an analysis as to the manner in which these sources were handled by local health executives:

	1932	1933
Under supervised medical treatment	61	59
Unable to locate the person named	55	42
Examined but found presumably non-infectious	43	34
Other acceptable disposition (agreed to take treatment, etc.)	11	23
Disposition unknown, or unsatisfactory (evaded supervision by moving, etc.)	7	3
Referred to health officials in other States	33	25
Handled by police authorities	7	3
No response from local health authorities	14	16
Total	231	205

The above is in addition to the cases where physicians have been instrumental in having the alleged sources brought in to them direct for examination and treatment.

Most physicians, realizing the infectiousness of gonorrhea and syphilis, urge their patients to help them in having all who may have been exposed undergo examination and treatment. This is one of the most valuable services a physician can render in the control of these diseases.

Excellent cooperation is being offered by nearly all local health executives. The Bureau stands ready to help when the situation seems complicated or the local official does not know quite how to handle a case.

New Clinics and Cooperating Physicians

A new list of venereal disease clinics and cooperating physicians has been published and is being circulated among physicians, health officers, and health workers, and a copy may be had on application.

The clinic at Weehawken has been discontinued and new ones opened at Bridgeton, Irvington and Penns Grove.

There have been many changes in the list of cooperating physicians. Through death we have lost the valuable services of Dr. George L. Mack, of Bound Brook:; Dr. R. B. Jarratt, of Penns Grove; Dr. Robert H. Reeves, of Paulsboro; Dr. H. H. Neldon, of Stanhope; Dr. Ralph S. Cone, of Westwood, and Dr. George L. Edwards, of Bogota. We are no longer represented at Collingswood, Leonia, Maplewood, Matawan, Newton, Phillipsburg, and Wildwood.

Summit, Bridgeton, Irvington and Penns Grove now have clinics; and new cooperating physicians are: Dr. E. H. Stillman, Audubon; Dr. T. M. Baird, Kearny; Dr. Clarence J. M. Hofer, Metuchen; Dr. Robert McC. Halbach, Toms River; and Doctors Charles T. Decker and L. H. Salvati, Westfield.

There are now 33 clinics in 28 cities, and 37 cooperating physicians.

Physicians Reporting Venereal Disease Cases

In addition to the list of clinics and cooperating physicians another list has been included in the leaflet for the first time this year. It contains the names of physicians who have reported three or more cases of venereal disease in their private practices during the past year, and who may therefore be said to have a familiarity with the treatment of syphilis or gonorrhea. The list will serve as a guide to the large number of physicians who do not treat gonorrhea or syphilis, giving them the names of physicians who, as shown by the State records, have familiarized themselves with the treatment of gonorrhea and syphilis, and to whom cases may be referred.

Venereal Disease Workers' Conference

The Third Annual Conference of Venereal Disease Social Workers was held under the auspices of the Bureau in connection with the Conference of New Jersey Social Workers, Thursday morning, December 1st, at the State House in Trenton. These

conferences were started three years ago with the idea of bringing together social workers in the venereal disease clinics throughout the State to hear discussions on matters closely relating to their work. Invitations have also been extended to clinicians, health officers, and to delegates generally to the State Conference of Social Workers. Usually there have been one or two principal addresses followed by a discussion of salient points relating to clinic and follow-up routine. At the 1932 meeting Dr. Walter Clarke, in charge of the Medical and Public Health Activities of the American Social Hygiene Association, spoke on the venereal disease clinic as it should be conducted in the large urban centers, and Dr. Franklin H. Church, Chief Clinician of the Salem County Venereal Disease Clinic, gave his experiences in the conduct of a successful rural clinic. Both papers were discussed at length bringing up the cleavage line between the health and police powers in the control of the venereal diseases.

Public Health Course

Two lectures were given by the Chief of the Bureau, on the duties of the local health officers in the control of the venereal diseases, to the senior class in a public health course at Rutgers. The Supervisor of Social Hygiene Education presented a series of views showing syphilis in an advanced stage.

Drug Supplies

The continuance of the depression has been marked by growth in the number of patients in clinics and at the same time by a contraction in funds provided by local budgets to meet increasing costs in the treatment of the venereal diseases. The small allotment of funds to the bureau for drugs to be used in the treatment of venereal disease is insufficient to cover all demands that are made upon it, but the Bureau of Venereal Disease Control has felt under obligation to take care of clinics in emergency cases and to help them along where otherwise they would be compelled to refuse patients. Clinicians have had their attention called to the provision in the State law requiring communities to treat

patients until non-infectious. Beyond that there is no legal obligation upon the health authorities. The Bureau has not recommended the discharge of any patient unless cured, if the community has the funds for treatment, but when it is a choice between a patient who has been under treatment for several years and one who is lately infectious, it is obvious that the protection of the public requires that the latter be treated rather than the former.

Drugs are supplied to cooperating physicians and also to physicians who in reporting a case of syphilis give the name and address of the source of infection.

Investigation

More than ever before has active assistance, especially in investigational work, been given to the local health officers. At the same time it is necessary to use some moderation in offering such assistance to avoid being imposed upon. The Bureau does not intend to supersede the local health officer, but will help with advice given in person. A striking instance of the value of this work has been the apprehension of a prostitute who voluntarily pleaded guilty to common prostitution and went to Clinton Farms where she is being given treatment. After her incarceration it was revealed that she had been the source of from 35 to 40 infections of gonorrhea in one neighborhood. On the advice of one of the Bureau representatives an indigent woman with tertiary syphilis, who had been a problem and passed on from one health board to another, was sent to the State Hospital for the Insane for treatment, as she was regarded as a fit subject for that institution.

An Industrial Clinic

A large industry in South Jersey employing colored men and women exclusively had the problem of syphilis among their workers thrust upon them. An investigation revealed that many of the workers, both men and women, were ignorant of the fact that they had syphilis but would gladly take treatment if it could be arranged. With the cordial cooperation of the corporation a

clinic was opened right on the grounds, a local physician engaged by the plant to examine the men and women and treat such as might be found to be infected. Six hundred and eighteen were examined, of whom 125 were positive, the syphilis ranging from primary to tertiary. Some moved away, but all of those who remained took treatment, the expenses being underwritten by the company. By now all of those originally found positive have become non-infectious and every new hand applying for employment is given a physical examination to determine the possible presence of a venereal disease. As a quasi-public clinic drugs were provided for its first year by the bureau.

Educational

New fields were discovered by the speakers representing the educational activities, and it is believed that the results will be appreciably felt in the control of the diseases.

It was found that many of the training schools for nurses limited their instruction on the venereal diseases strictly to the medical phases, not taking up the very important social and public health points of view. Accordingly each training school for nurses in the State was offered the services of speakers to discuss "The social phases of the venereal diseases," "The technique of sex education," and "The venereal diseases from a public health standpoint." The schools had the privilege of accepting any of the addresses, if they did not care for the three. It is evident that the lectures filled a need, for sixty-four talks were given in twenty-six hospitals. Close attention was given to all the lectures, and the speakers almost invariably commended highly by the director in charge. This newer knowledge of the venereal diseases can hardly fail to be an efficient preventive factor in later years.

Illustrated talks on venereal diseases have been given in several of the penal institutions of the State where older boys have been confined. When the meeting has been thrown open for questions at the conclusion of the lecture, the speaker is literally assailed from all sides by questions, frequently consuming over an hour for the questions and answers. The subject is a live one with

most of the inmates and yet they had a pitiful ignorance as to the diseases and their causes.

When Venereal Disease Comes to School

It may startle some to know that the venereal disease is an occasional visitor in the primary schools. Although it does not often appear, when it does it is an occasion for turmoil and confusion. Students are withdrawn, innocent children are suspected, and no one seems to know how or what to do. Usually the Bureau of Venereal Disease Control is appealed to, to lock the stable door after the horse has been stolen.

The idea was conceived to familiarize the teachers with the proper mode of procedure "when venereal disease comes to school" and supervising principals were asked to call special meetings of the teachers in their jurisdictions to hear the matter discussed by the Supervisor of Social Hygiene Education in the Bureau, who also conducted a round table discussion. Enough of these discussions were held to demonstrate the value of the plan, and emphasis will be placed upon it for the coming year.

High School

Every year high schools that have never availed themselves of the talks on sex hygiene to boys and girls become applicants for these addresses, and it is especially pleasing to know that during the past year the Atlantic City High School and both the Lincoln and Dickinson High Schools in Jersey City became applicants for the lectures for the first time. In these three schools several days were devoted to each, the boys and the girls. The groups were split up into approximately one hundred and fifty each, or as many as would be in a gymnasium class. Forty-six addresses were given in the two Jersey City High Schools.

Camp Dix

The most spectacular phase of the educational activities undoubtedly was the work undertaken at Camp Dix in the last five

weeks of the fiscal year. Camp Dix in Burlington County was selected by the Federal Government as one of the headquarters for the Civilian Conservation Corps of young men enlisted for reforestation service under President Roosevelt's unemployment relief plan. The camp was placed under the control of the United States Army with a Brigadier-General in command. The Bureau rendered the Provost Marshal valuable assistance in ridding the vicinity of the camp of infectious prostitutes, and in breaking up some public dances where the girls engaged were of a questionable character.

The Commanding General saw the need of constructive, preventive work done with the young men, and he gave the Chaplain, Moral Officer of the Camp, *carte blanche* to go ahead and make arrangements with the Bureau to handle the situation. The reforestation men made up two units of approximately 7,000 each, each unit being in camp two weeks. It was decided that the men needed straight-out, direct information about veneral disease, which meant showing a series of films illustrating pathological specimens of the disease. The only hall suitable had a capacity of about 375. With the first unit one company was addressed at a time. This necessitated five talks a day before the men were covered. With the second unit two companies were addressed at a time, requiring only three meetings a day. The Supervisor of Social Hygiene Education and the Chief of the Bureau addressed each meeting, answering fully questions by the hundred, distributing copies of Man Power, and in the course of four or five weeks 88 addresses were made covering practically all the men in the Civilian Conservation Corps. The difficulty of the work will be understood when it is realized that the talks were given during one of the heated spells in late June, in a comparatively small room with both doors and windows closed to keep out the light. It required extraordinary endurance on the part of the speakers to go through with the work as planned. But they felt repaid when men, after an hour spent in a veritable sweat-box with the thermometer ranging around 100°, listening to talks on venereal disease, rewarded the lecturers with round after round of applause.

Groups Addressed

During the fiscal year meetings have been held as follows:

Name of Group	*Number of Meetings*	*Attendance*
Children of high school age	192	31,240
Civilian Conservation Corps	88	25,600
Parent-Teacher Associations	80	4,654
Nurses	64	2,665
Teachers	14	656
Kiwanis Club	10	430
Lions Club	10	310
Rotary Club	9	331
I. O. O. F. Lodges	7	326
Woman's Club	6	289
Reformatory Inmates	4	2,050
Junior Order United American Mechanics	4	865
Colored Groups	4	240
Clinic Social Workers	3	100
Public Health Course	3	37
American Legion	2	225
National Guards	1	75
Sons of St. George	1	75
Hi Y Boys	1	45
Masonic Lodge	1	40
Church Men's Club	1	38
State Normal Boys	1	30
N. J. State Safety Patrol	1	25
Service Clubs Council	1	10
Total	508	70,356

Below is a recapitulation of the number of meetings, the total attendance and the pamphlets distributed for each year since 1920:

	Number of Meetings	*Attendance*	*Pamphlets Distributed*
1920	376	72,192	353,873
1921	255	28,912	84,389
1922	232	28,111	120,032
1923	229	30,058	65,668
1924	300	41,629	49,560
1925	334	39,415	45,000
1926	357	38,923	50,000
1927	307	35,095	89,354
1928	308	28,624	38,146
1929	285	28,151	30,589
1930	388	37,954	49,502
1931	421	31,316	52,778
1932	327	25,276	27,279
1933	508	70,356	18,578
	4,627	535,912	1,074,748

The magnitude of the lecture activities may be gauged from the number of meetings; eighty-seven more than any other year since the establishment of the Bureau, and the attendance only 1,800 under the first year when the impetus of the governmental activities was still being felt and when the Bureau had a federal appropriation of $27,500.

MEETINGS HELD EACH MONTH, WITH THE TOTAL ATTENDANCE FOR THE MONTH, AND THE TYPE OF ATTENDANCE AT THE MEETINGS

NEW LAW

The New Jersey Health Officers Association, realizing the need of a revision in the venereal disease enforcement law, sponsored the introduction of a bill in the General Assembly, making some basic changes in the present law. The bill passed both houses, with a slight amendment added in the Senate, and is now known as Chapter 261, P. L. 1933. The old law, Chapter 253, P. L. 1918, provides for the action to be taken by the local health executive upon receiving a report of an infection of venereal disease, from the Surgeon General of the United States Army or Navy or from the Commanding Officer of any military or naval organization situated in the State, etc. This feature of the bill, a "hang over" from the war-time legislation of 1918, was amended so as to provide that the action should be taken by the local health executive on receipt of such report from the Director of Health or anyone authorized by him to make the report.

The important change in the law, however, was in Section 7, and will best be understood by giving the section as it stood; namely:

> "Cases of gonococcus infection are to be regarded as infectious until at least two successive smears taken not less than forty-eight hours apart fail to show gonococci. Cases of syphilis shall be regarded as infectious until all lesions of the skin and mucous membranes are fully healed. Cases of chancroid shall be regarded as infectious until all lesions are fully healed."

Which will readily be recognized as an outgrown definition of infectiousness. Patients may be negative as to two smears, or have all their syphilitic skin lesions fully healed, yet still be virulently infectious. It is fortunate indeed that no legal action was ever brought to test the legality of holding patients as still infectious under those conditions.

Section 7 has been amended to read as follows:

> "A case of syphilis, gonorrhea or chancroid shall be regarded as infectious until a physician licensed to practice medicine, has examined the case and has reported to the local health department that the case is not infectious, but if in the opinion of the health officer of the jurisdiction the protection of the public health requires it he shall have power to review the case and to cause a medical examination of any such case to be made by a physician designated by him and the opinion of this physician as to the infectiousness or non-infectiousness of the case shall be final."

The importance of the latter change cannot be over-estimated. Now the attending physician is the judge as to whether or not a patient is infectious, leaving the health officer the privilege of appeal to another physician whose decision is final. The passage of this law is without doubt one of the most important factors in venereal disease control that has happened in New Jersey in the last ten years.

Report of the Bureau of Public Health Education

For the Year Ending June 30, 1933

EDWIN C. LANIGAN, CHIEF

Public health education in New Jersey during the fiscal year consisted principally of dissemination of information through the medium of the public press and magazines. The press of New Jersey was very responsive to material furnished by the bureau. The magazine of the League of Municipalities carried a series of articles relating to the activities of the State Department of Health, its legislative program and subjects pertaining to public health.

Emphasis was placed upon the department's program urging the public to consult physicians for treatment of maladies.

The Bureau carried on publicity activities of the department. An intensive campaign was continued to acquaint the public with the various lines of work centered in the department.

Governmental experts have publicly commended the advisability of providing the department with an adequate appropriation to inaugurate an educational campaign which might eventually result in a substantial curtailment of the State's growing burden for institutional care. Such a recommendation is based on the theory that prevention will return greater dividends than subsequent cure after custodial care.

A better understanding on the part of the public of the services rendered by the department to the physicians of the State in diagnosis of communicable disease specimens and the work of our laboratories in analyzing food products and milk supplies would bring the department moral support to extend its work.

Administration of Chapter 175 of the Laws of 1933, adopted May 24, 1933, was placed in the Bureau of Public Health Educa-

tion. The act provides for the registration of those practicing barbering. It provides for the appointment of three examiners, one recommended by the Master Barbers' Association of New Jersey, the second by the Journeymen Barbers' Association, and the third member to be appointed by the State Department of Health.

The bureau had exhibits at fairs in Trenton, Flemington, Bridgeton and Egg Harbor. It also took part in the Summer School for health workers conducted jointly by the department and Rutgers University.

Report of the Bureau of Vital Statistics

For the Calendar Year 1932

DAVID S. SOUTH, STATE REGISTRAR

The Bureau, which was established in 1878, has the custody of more than seven million records of births, marriages and deaths which date back to 1848. In 1932 more than 13,000 searches were made and copies of the records found issued, for which $7,516.00 were received and paid to the State Treasurer. Approximately 5,000 of the copies were issued to widows, veterans and veteran's organizations for compensation and other pension purposes; for children to enter school or procure employment; for enlistment in the Army or Navy of the United States, for all of which purposes no charge is made.

The registration of births, marriages and deaths was supervised in each city, borough and township of the State. Blanks for birth, marriage and death certificates, burial and transit permits and other forms were supplied by the Bureau as required by law.

During the year 1932, the Bureau received, examined, classified, indexed and permanently filed more than 135,000 certificates of births, marriages and deaths, part of which records were for unreported events which occurred in past years. The annual growth of the records requires approximately two hundred cubic feet of storage space.

An effort was made to further improve the marriage laws by preparing and introducing into the House of Assembly a revision of the marriage laws. It was impossible to secure the release of the bill from the Committee.

Previous efforts to obtain the much needed repair and restoration of the records of births, marriages and deaths from 1848 to

1867 were successful. Those old records, which were received from the Secretary of State more than fifty years ago, were reconditioned, repaired with Japanese tissue and rebound in canvas.

The Bureau compiled an increased amount of special statistical data, for the use of insurance companies, chambers of commerce, students, statisticians and agencies interested in disease and accident prevention.

General Summary

	1920	*1930*	*1932*
Births registered, tabulated and indexed	76,431	68,282	61,215
Marriages registered, tabulated and indexed ..	31,327	28,499	22,840
Deaths registered, tabulated and indexed	40,820	43,190	42,826
Stillbirths registered, tabulated and indexed ..	3,221	2,647	2,343
Total records registered, tabulated and permanently filed	151,799	142,618	129,224
Searches made and certified copies issued for which fees were received	4,664	10,523	8,489
Certified copies issued and searches made in pension and other cases for which no fees were received	4,232	6,938	4,743
Fees returned to State Treasurer for searches and certified copies	$4,051	$9,601	$7,516

Charts and Tables, 1932

Table 1. Births, marriages and deaths reported, with rates, 1879-1932.

Table 1a. Births, marriages and deaths and deaths under one year of age by counties, cities, boroughs and townships.

Table 2. Deaths by age groups, with the percentage which each group forms of total deaths: 1932.

Chart 1. Total deaths per 1,000 population for 54 years.

Table 3. Deaths of infants under five years of age and percentage of total deaths, 1904-1932.

Chart 2. Deaths under five years of age per 10,000 population for 54 years.

Table 4. Number of births, stillbirths, deaths under one month, deaths under one year and maternal deaths with rates per 1,000 live births, 1906-1932.

Table 5. Deaths under one year, deaths under one month, stillbirths and maternal deaths per 1,000 live births, by counties.

Table 22. Death by causes, sex, color and age periods in the counties and cities having 10,000 or more inhabitants in 1930 (county figures include cities which follow):

Atlantic County—
- Atlantic City
- Pleasantville

Bergen County—
- Cliffside Park
- Englewood
- Garfield
- Hackensack
- Lodi
- Ridgefield Park

- Summit
- Westfield

Warren County—
- Phillipsburg

Population—The estimated mid-year population of the State for 1932 was 4,235,698. These figures were obtained by the arithmetical method, using the United States census figures for 1920 and 1930. The estimated population of the counties and incorporated municipalities of the State having 10,000 or more inhabitants in 1930 appears at the foot of the mortality tables for the places.

Births—The number of births for 1932 was 61,215 which was equivalent to a rate of 14.4 per 1,000 population. Total births reported decreased almost 3,000 from the number for the previous year. The 1932 rate was the lowest since 1905. It is likely that a higher rate would have prevailed in 1905 had all births been reported. The low figure for 1932 is a continuance of the decline in evidence since 1917 when the rate was 24.9.

Marriages—The number of persons married during 1932, per thousand population, was 10.7, which rate was the lowest since marriage statistics were first compiled in 1879. The ease and rapidity with which marriage licenses can be secured in certain adjacent States materially affect the New Jersey rate. Economic conditions were also a considerable factor and were undoubtedly partly responsible for the gradual decline which has occurred in the marriage rate during the past ten years.

Deaths—The death rate for 1932 of 10.1 was the lowest rate since the State Department of Health was established fifty-five years ago. The previous low rate was 10.6 for 1930 and 1931.

TABLE 1—POPULATION; BIRTHS, MARRIAGES AND DEATHS REPORTED WITH RATES PER 1,000 POPULATION

YEAR	Estimated Population	BIRTHS		MARRIAGES		DEATHS	
		Number of births reported	Birth rate per 1,000 population	Number of marriages	Persons married per 1,000 population	Number of deaths	Death rate per 1,000 population
1879	1,020,584	23,116	22.65	7,096	13.91	20,440	20.03

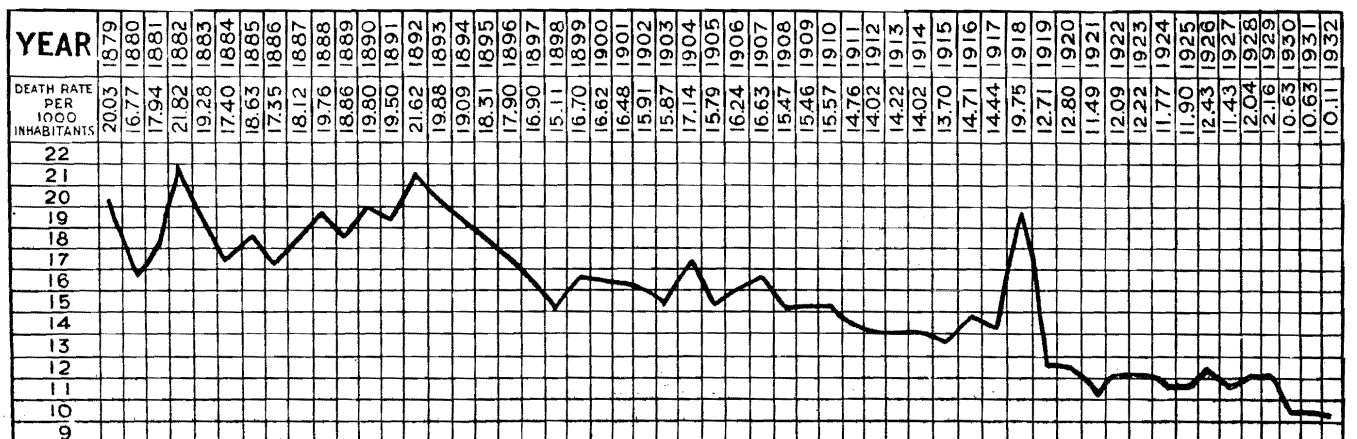
CHART 1—TOTAL DEATHS PER 1,000 POPULATION FOR 54 YEARS



Infant Mortality—The infant mortality rate for 1932 was 50.4 per 1,000 babies born alive. This was the lowest infant mortality rate attained in New Jersey. The previous low rate was 56.6 for 1930. The rate for 1931 was 56.9. Reference to Table 4 will show the great decrease in the infant death rate in New Jersey since extensive baby welfare work was undertaken.

Colored Races—The infant mortality rate for the colored races was 92.8. The colored races have shown high mortality rates ever since vital statistics were first collected and analyzed.

Maternal Mortality—This rate for 1932 was 5.7 and for 1931, 5.9. It is regrettable that a decrease comparable to the infant mortality decline has not been shown in deaths due to maternity. The colored maternal mortality rate was 6.3.

Stillbirths—The number of stillbirths reported for 1932 was 2,343. The number for the previous year was 2,578. The 1932 rate was 38.2 per 1,000 live births. The rate for the colored population was 55.4.

TABLE 3—NUMBER OF DEATHS AT ALL AGES, UNDER ONE YEAR OF AGE AND UNDER FIVE YEARS OF AGE, AND THEIR PERCENTAGES OF TOTAL DEATHS

Typhoid Fever—The death rate for this disease (including paratyphoid) for 1932 was only 0.07 per 10,000 population, which was the lowest rate ever attained in New Jersey. That the rate was indeed low was proven by the 1931 rate of 0.44 for the United States Registration Area. The rate for the Registration Area for 1932 was not available. The number of deaths from typhoid fever and other diseases of the international list of causes of death by counties and cities can be obtained by referring to Table 20. Table 22 shows the more important causes by sex, color and age groups.

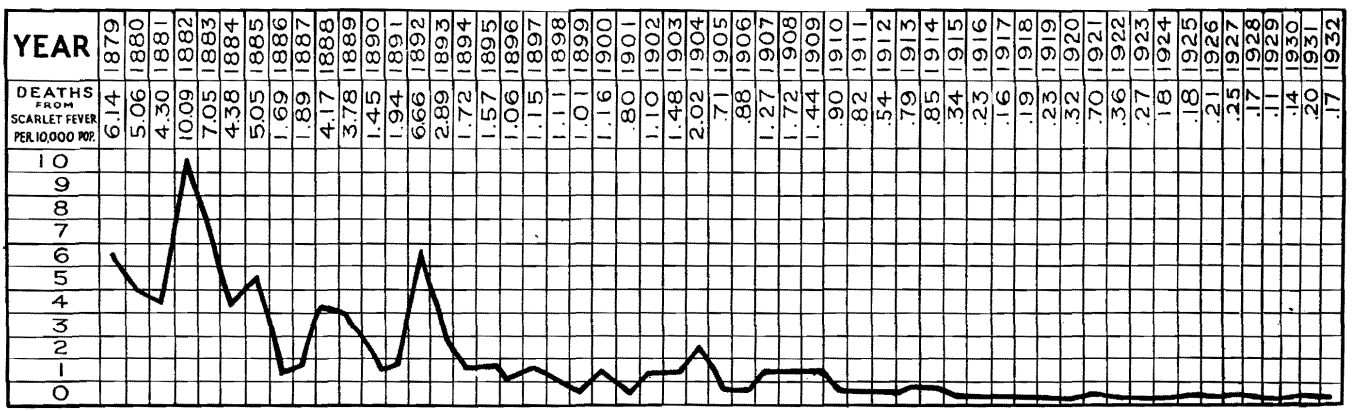
		1918 13	1932 3

Smallpox—During 1926, 1927, 1928, 1929, 1930, 1931 and 1932, no deaths from smallpox occurred in New Jersey. During the two years previous to 1926 deaths occurred as the disease was prevalent in epidemic form in certain sections of the State.

Measles—This disease was responsible for 41 deaths in 1932. During the preceding year a total of 95 deaths occurred. In 1929 there were only 33 deaths from measles.

Scarlet Fever—Very little variation was noted in the death rate from this disease for the past ten years. The average rate for the period was about one half the rate which prevailed during the previous decade.

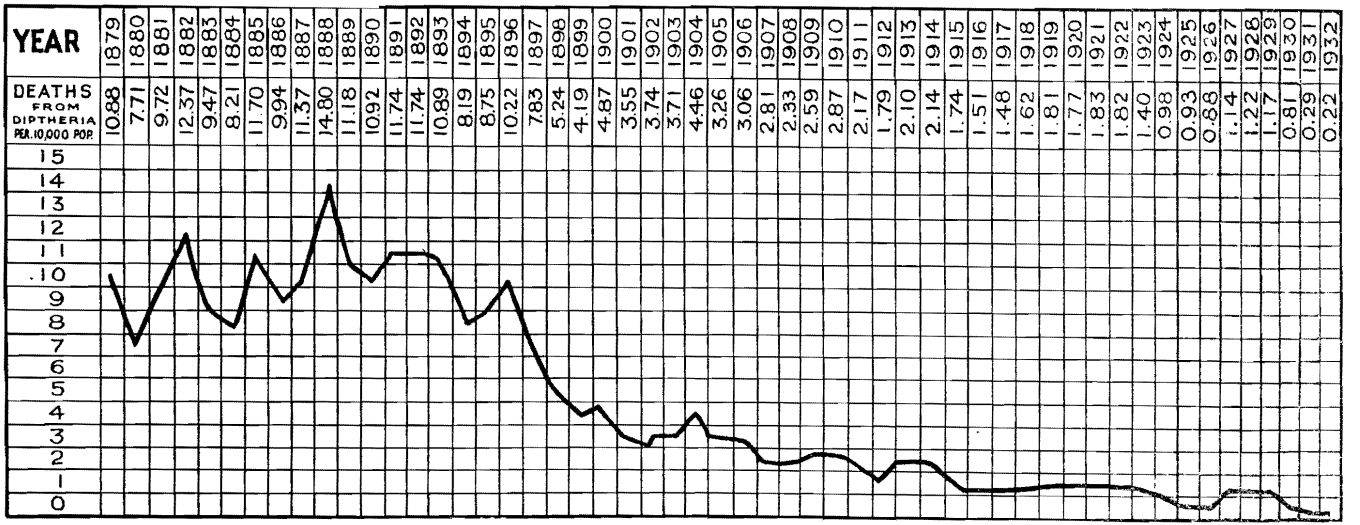
CHART 4—DEATHS FROM SCARLET FEVER PER 10,000 POPULATION FOR 54 YEARS



Whooping Cough—This disease caused 123 deaths in 1932; for 1931 the number was 136 and for 1930, 90.

Diphtheria—During 1932 only 97 persons died from diphtheria and laryngeal croup, equivalent to a rate of 0.22 per 10,000 population, compared with 0.29 for the previous year and 0.81 for 1930. The death rate from diphtheria for 1888 was 14.8 per 10,000 population. During the decade beginning with 1900 the rate declined from 4.8 to 2.5. The following ten year period showed a decline to 1.8. The rate for 1932 was the lowest recorded.

CHART 5—DEATHS FROM DIPHTHERIA PER 10,000 POPULATION FOR 54 YEARS



Tuberculosis—The number of deaths from all forms of tuberculosis during 1932 was 2,569. The number of deaths from tuberculosis of the respiratory system was 2,311. The death rates per 10,000 population were 6.06 and 5.45 respectively. These were the lowest tuberculosis death rates recorded in New Jersey.

* It should be noted that these rates are for tuberculosis of the respiratory system. Rates of all forms of tuberculosis appear among the tables of the Bureau of Local Health Administration.

CHART 6—DEATHS FROM TUBERCULOSIS OF LUNGS PER 10,000 POPULATION FOR 54 YEARS

Cancer—The death rate from cancer and other malignant growths for 1932 was 11.31 per 10,000 population compared with 11.35 for the previous year. The mortality from this disease, with few exceptions, has steadily increased during the fifty-four years recorded in New Jersey.

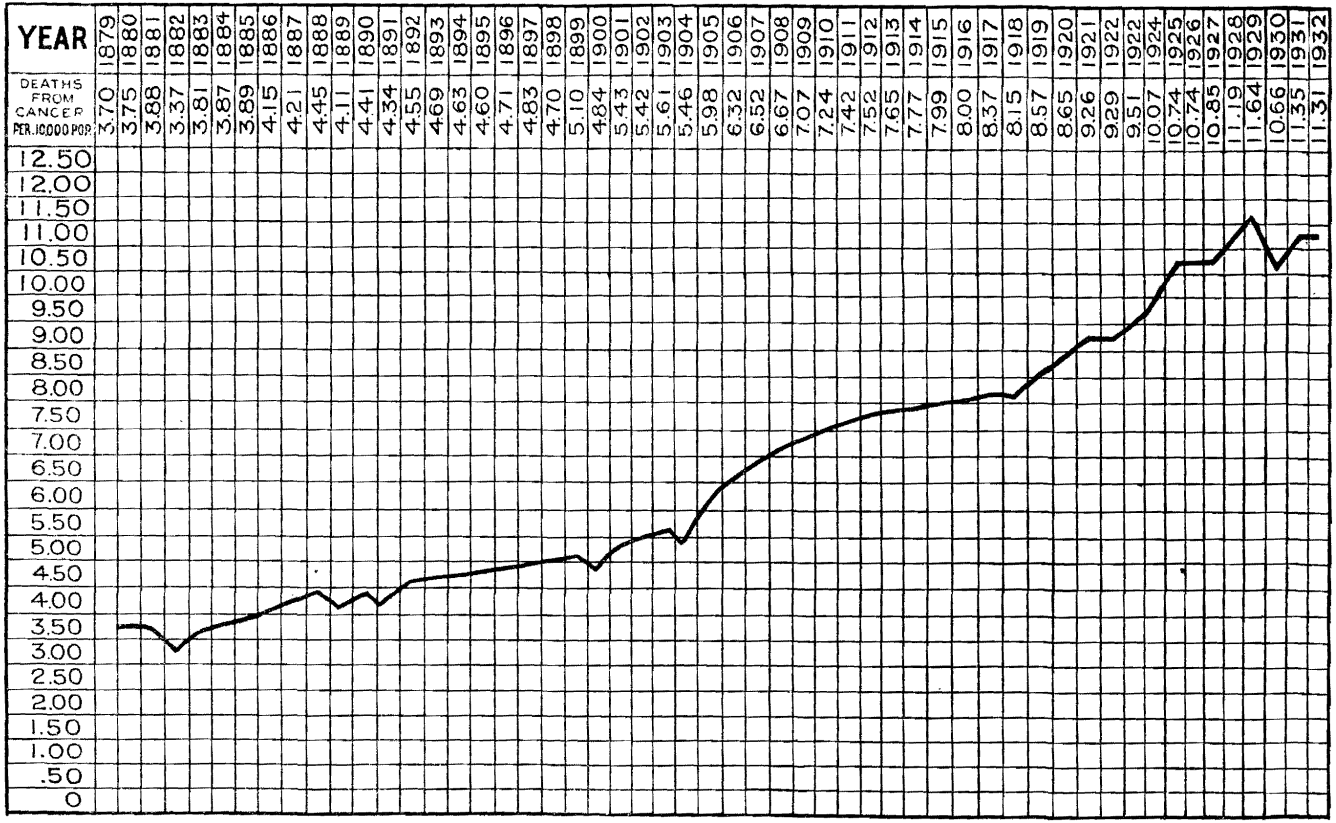
CHART 7—DEATHS FROM CANCER PER 10,000 POPULATION FOR 54 YEARS



Encephalitis Lethargica or Sleeping Sickness—Thirty-five deaths were assigned to this affection for the year 1932. In 1922, which was the first year that the disease was separately classified, there were forty-five deaths, while for 1931, 37 deaths were recorded.

Bright's Disease—Deaths due to acute and chronic nephritis totaled 3,865, compared with 3,941 for the previous year.

Suicide—Deaths by this means increased considerably during the years 1927 to 1932. Of the various means employed poisonous gas was responsible for the most deaths with firearms and hanging in second and third places. The number of deaths by suicide for six years follows:

1927	505	1930	601
1928	565	1931	694
1929	622	1932	740

Automobile Fatalities

Deaths due to accidents in which moving automobiles were involved total 1,158 compared with 1,302 for 1931. The figures include 10 deaths due to motorcycle accidents and 19 deaths of bicyclists who were struck by automobiles, but are exclusive of 35 accidental deaths due to the inhalation of motor exhaust.

Analyzed the motor fatality data show the death of 620 pedestrians, which number is equivalent to 53 per cent of the total. More than one fourth of the pedestrians who died were children under fifteen years of age. Sixteen per cent of the drivers and occupants of automobiles who were killed were less than twenty years of age.

The following table shows deaths, in New Jersey, of both residents and non-residents of the State, arranged by age groups:

Motor Vehicle Fatalities by Age Periods, 1932

	Pedestrians Struck by Motor Vehicles		*Deaths From Other Motor Vehicle Accidents*		*Totals*
