SECTION I

- A. Introduction**
- B. General Basin Characteristics**
- C. Delaware River Basin Water Code**

A. Introduction

Comprehensive Plan, Codification, Authority, Purpose and Scope

- a. **Codification of Comprehensive Plan:** This document is a codification of the Commission's existing Comprehensive Plan. It contains the policies, projects and facilities, which constitute the Comprehensive Plan of the Delaware River Basin Commission. (Commission or DRBC) This codification does not contain new policies or new projects. It is a compilation of all past Comprehensive Plan actions by the Commission. The more than 1700 projects added to the Comprehensive Plan over the past 39 years are summarized in a listing in Section II Part D. The complete project description as included in the Comprehensive Plan may be found in the referenced Docket listed for each project. Description of major projects have been included.

- b. **Authority:** Article 13 and Section 3.1 of the Delaware River Basin Compact provides that the Delaware River Basin Commission shall develop and adopt, and may from time to time review and revise, a Comprehensive Plan for the immediate and long-range development and use of the water resources of the Basin. The Plan shall include all public and private projects and facilities which are required, in the judgement of the Commission, for the optimum planning, development, conservation, utilization, management and control of the water resources of the Basin to meet present and future needs.

- c. **Purpose:** Section 13.2 of the Delaware River Basin Compact specifies that the Commission shall annually adopt a water resources program consisting of the projects and facilities which the Commission proposes to be undertaken during the ensuing six years or such other reasonably foreseeable period as the Commission may determine. The water resources program must be based upon the Commission's Comprehensive Plan.

Section 3.8 of the DRBC's Compact also requires any project having a substantial effect on the water resources of the Basin to be approved by the Commission before it is undertaken by any person, corporation or governmental authority. The Commission must approve a project whenever it finds and determines that such project would not substantially impair or conflict with the Comprehensive Plan and may modify and approve as modified, or may disapprove any project whenever it finds and determines that the project would substantially impair or conflict with the Plan.

DRBC's Rules of Practice and Procedure in Article 1, Section 2.1 set forth the provisions, which govern the submission, consideration and inclusions of policies, projects and facilities into the Comprehensive Plan.

- d. **Scope:** The Comprehensive Plan, including its various parts, is intended to describe the general characteristics of river basin development which the Commission finds to be in the public interest. It does not mandate construction of any project or the acquisition of any land. It provides only a flexible, growing and evolving general framework for the orderly development of the water and related resources of the basin. Section 3.8 review authority provides the opportunity for the Commission to coordinate all activities that could impact existing or proposed water resources projects in the Comprehensive Plan.

While the Comprehensive Plan is designed to be continuously updated, it is planned that major changes may occur in the short term as a result of the *Flowing to the Future* workshops and the directions that flow from the Governor's Conference. In addition, the on-going work just beginning on the Flow Needs Study may result in a significant revision or redirections. It is the Commission's intention that a new Comprehensive Plan will be developed in conjunction with and in response to these on-going studies.

The Comprehensive Plan was initially adopted by DRBC Resolution No. 62-4 on March 28, 1962. The Plan stated it was to be a body of documents expressing a systematic set of policies and programs for the future, together with consistent means for carrying them out that could be expressed in a variety of ways: through narrative text, maps, charts, schedules, budgets and even legislative text.

Since its initial adoption, the Comprehensive Plan has been regularly modified and supplemented. Continuing study of the needs of the basin will always be the key to the Comprehensive Plan. From time to time, therefore, specific projects and facilities and programs will be incorporated, deleted or modified to reflect changing conditions, research results and new technology. Changes in the Plan will be adopted by the Commission only after adequate notice and public hearing.

Phase I of the existing Comprehensive Plan (1962) includes specific projects and proposals, as well as basic economic premises, which have been accepted by the Commission as conforming to the requirements of a Comprehensive Plan. In general, the criteria by which this acceptance must be measured are as follows:

The project must provide beneficial development of the water resources in a given locality or region;

It must be economically and physically feasible;

It must conform with accepted public policy; and

It must not adversely influence the development of the water resources of the basin.

The Plan is not intended to prescribe as to specific areas, design, or function of future projects. Even though the projects are described in the Plan with some reference to technical characteristics, this is primarily for a better understanding of the type of project rather than any prescription of what may be required. The projects may be modified in detail, location, acreage and other features as they move from the planning stage into the stage of design and blueprinting. In particular, it should be noted that the specific acreage of lands to be acquired for any future projects is not fixed by the Comprehensive Plan but is left to specific determination when the project is authorized to be undertaken. Meanwhile, tentative taking lines have been indicated so as to allow adequate lands for recreation, watershed protection, conservation and other water resources purposes beyond the needs of flood control or water supply alone.

Financial arrangement for the various projects are also omitted. The Plan does not mandate any expenditure by any public or private agency, or require any contribution to the cost of a particular project. All financial arrangements are left to be worked out, project by project, in accordance with such cost sharing arrangements as may be found to be fair and reasonable.

B. General Basin Characteristics:

The physical description of the Delaware River Basin as summarized below, was incorporated as background for Phase I of the original Comprehensive Plan.

Stretching approximately 326 miles from head-waters to mouth, the Delaware River and its tributaries drain a 12,765 square-mile land area in the northeastern United States. Encompassed within the drainage basin are 2,363 square miles in southeastern New York, 6,422 square miles in eastern Pennsylvania, 2,969 square miles in western New Jersey, 1,004 square miles in Delaware, and 8 square miles in Maryland. The area of Delaware Bay adds 782 square miles of water surface to the Delaware River system. On the basis of its physical characteristics, the Basin divides naturally into three general physiographic definitions, namely, the Upper, Central and Lower Regions.

The highlands of the southern Catskill and Pocono Mountains are the dominating characteristics of the Upper Region. Here is found the Basin's maximum elevation of 4,200 feet. Geologically the region is part of the "hard" rock area where bedrock is resistant to erosion. It is almost completely forested, with mixed hardwoods predominating, and almost totally glaciated. The region exhibits the characteristics of a plateau of flat-lying rocks cut by narrow valleys that have been deeply carved by the river and its tributaries. Mean annual temperature is 47 degrees. Mean annual rainfall varies from 60 inches in the mountains to 42 inches in the lower lying areas. Mean annual snow accumulation is 60 inches.

The Central Region extends from an upper limit generally marked by the Valley and Ridge physiographic province, with its pattern of parallel ridges running northeast to southwest, to a lower limit marked by the Fall Line, where there is a sharp drop of 250 to 350 feet in elevation to the Atlantic Coastal Plain. The Fall Line forms an irregular south-facing escarpment between the undulating plateau and the Coastal Plain: it lies along a line passing through Trenton, New Jersey and Wilmington, Delaware. Within the Central Region important physiographic features include the Blue Mountain-Kittatinny Mountain Ridge, and the Great Valley extending northeast-southwest across the Basin. The region also lies in the "hard" rock area. Only its northeast portion has been glaciated. About a third of the region is forested, and rich soils support important agricultural activities in many areas of the region. Mean annual temperature is 50 degrees. Mean annual rainfall ranges from 30 inches in the upper reaches of the Schuylkill River to 42 inches along the lower reaches of the Lehigh River. Mean annual snow accumulation is 25 inches.

The Lower Region covers the area from the Fall line to the Capes of Delaware Bay. Physiographically the region is the emerged part of the Coastal Plain, a gently sloping surface extending 125 to 175 miles southeasterly from the Fall Line to the Continental Shelf. Geologically, the region is a "soft" rock area composed of overlapping beds of unconsolidated or semi-consolidated clay, silt, sand and gravel. Delaware Bay is the Region's most marked feature. About one-third of the region is wooded with about equal divisions between soft and hard woods. The soil supports a variety of important agricultural activities. Mean annual temperature is 55 degrees; mean annual rainfall is 43 inches, and mean annual accumulated snowfall is 20 inches.

Starting in the Upper Region, on the western slopes of the Catskill Mountains, the Delaware River first emerges as the southwesterly-flowing East Branch and West Branch which joins at Hancock. From that point southeastward to Port Jervis the river divides Pennsylvania and New York. In this stretch it receives the flows from three important tributaries: the Lackawaxen, Mongaup and Neversink.

Turning southwestward at Port Jervis, the River enters the Central Region where it becomes the dividing line between New Jersey and Pennsylvania. Here it flows in a narrow valley between the Shawngunk Mountains on the east and the Appalachian Plateau on the west. Near Stroudsburg it cuts to the southeast through the Blue Mountain-Kittatinny Mountain Ridge at the Delaware Water Gap. Such important tributaries as the Bush Kill, Brodhead Creek and Flatbrook join the River just above the Water Gap, and Lehigh Paulins Kill, Beaver Brook, Pequest Musconetcong join below.

At Trenton the River comes into the Lower Region and enters the tidal estuary. Turning southwest, its course parallels the Fall line to Wilmington. In this reach it receives the flows of the Neshaminy, Schuylkill, Rancocas and Christina tributaries. Just below Wilmington the River turns seaward and flows to Liston Point where it enters the Delaware Bay.

- C. Pre-Compact Municipal Water Supply
& Waste Disposal Projects**
- D. Projects Approved
(DRBC Compact 3.2 & 13.1)**

DRBC Comprehensive Plan – Phase I (Year 2001 Codification)

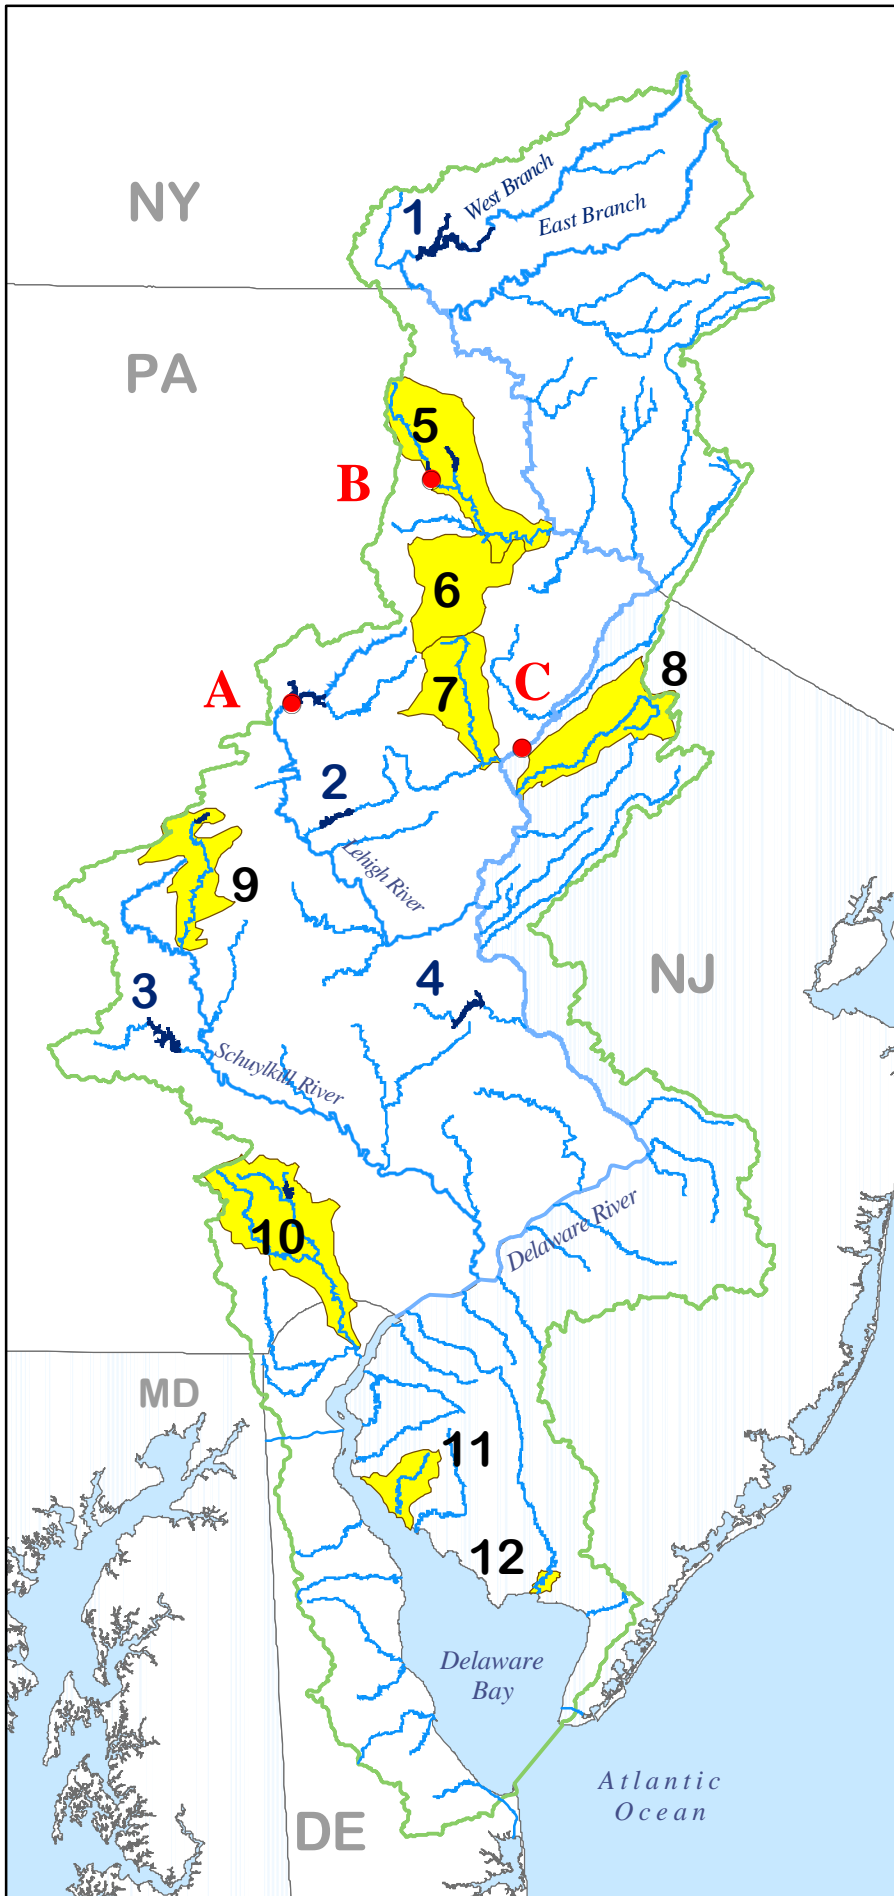

Section II: Proposed and Existing Reservoir Projects

Background Information – The following two sections present the proposed and existing major reservoir projects in the Delaware River Basin. The original Section II – A included several projects that have since been implemented and are listed in Section II-B, as existing reservoirs. Several projects were officially de-authorized by the Army Corps of Engineers and removed from the Comprehensive Plan by previous actions of the Delaware River Basin Commission. In addition, the Natural Resources Conservation Service has updated the descriptions of various watershed projects, generally to conform with as-built conditions. These modifications are reflected in these sections. The following map shows the location of the existing and proposed major reservoirs and the watersheds, where several small projects have been implemented.

More detailed site maps and engineering specifications for the projects are available for inspection at the Commission's Office, 25 State Police Drive, West Trenton, New Jersey.

12	Maurice River Cove

SECTION II–A MAJOR PROPOSED PROJECTS

1. Revised Comprehensive Plan Description of Francis E. Walter Reservoir and Proposed Modification Project

Description

The Francis E. Walter Project was completed in 1961 as a single-purpose flood control project (with incidental recreation use). However, it was approved for multiple-purpose development to provide supplies of water and recreational use, as well as the presently authorized flood control. The earth and rock fill dam is located on the Lehigh River 77 miles above its confluence with the Delaware River and approximately five miles north of White Haven, Pennsylvania. At this location the dam controls 288 square miles of drainage area.

The modifications to the existing dam, as originally proposed by the Corps of Engineers to make it serviceable for long-term storage, in addition to the present flood control storage, involve:

1. Moving and raising the spillway crest.
2. Raising the dam.
3. Adding a concrete conduit to the downstream end of the outlet tunnel.
4. Constructing new dikes and raising existing dikes north of the dam.
5. Clearing of reservoir land and relocating roads subject to inundation.

The modified dam would rise approximately 263 feet above the stream-bed and have a length of approximately 3,500 feet. The spillway would be raised 31 feet and cut through rock to the north of the dam, and farther north, a dike would fill a swale in the reservoir rim. Multi-level outlet works would be provided in the new project. For long-term storage of approximately 69,500 acre-feet of water the reservoir would have a maximum depth of approximately 185 feet and would extend approximately seven miles up the Lehigh River and approximately four miles up Bear Creek from the dam. Modification of this reservoir would necessitate the purchase of land to be inundated, on which easements have already been taken and require the acquisition of additional flood easements at high elevations. Permanent inundation of 1,215 acres of grassland and mixed hardwood forest would result, as well as periodic inundation of 560 acres of hardwood forest. No economically valuable mineral deposits would be flooded. Relocation of approximately five miles of Bear Creek Road would be required. Studies by the Corps of Engineers during the detailed design stage evaluated the impact of the raised storage on the upstream area in the vicinity of Stoddartsville, Pennsylvania, and every effort would be made to avoid inundation of all historic sites and to preserve aesthetic values, including waterfalls. Also, studies by the Corps of Engineers during the detailed design stage have addressed concerns regarding dam safety.

Functions

Supplies of Water. The modified project would augment the flow of the Delaware River at Trenton, NJ by 290 cfs on the basis of complete and uniform drawdown of flow augmentation storage (69,500 acre-feet) over a 120-day period.

Reduction of Flood Damages. The 108,000 acre-feet of existing short-term storage is effective in alleviating flooding in the upper reach of the Lehigh River, where damage is primarily confined to the towns of Jim Thorpe, Lehighton, Weissport, Parryville, Palmerton, and Bowmanstown, Pennsylvania. Damage centers in the reach from the Lehigh Gap to Allentown, Pennsylvania, include industrial and residential areas located in the vicinity of the Towns, of Northampton, Hokendauqua, Catasauqua, Allentown, Bethlehem, Freemansburg and Easton, Pennsylvania. The flood control protection would be preserved as previously authorized, and flood reduction benefits will be unaffected by the modifications.

Recreation. The modified Francis E. Walter Reservoir Project would provide for public ownership of the desirable shore area and provide space for development of recreation sites. Operation of the project will consider the downstream flow requirements for stream fisheries and the management of the impoundment for lake fisheries. The impact on the nearby communities of adding recreation as a project purpose have been evaluated and will be reevaluated during the environmental review of the modification. The Commonwealth of Pennsylvania will cooperate with the communities involved to minimize potential adverse impacts, and to promote environmentally sound planning for local development in the area.

Schedule

Modification of the existing Francis E. Walter Reservoir Project will be reconsidered after completion of additional flow needs analysis.

Approval of this project is subject to the following conditions:

- a. The Corps of Engineers shall complete and submit to the Commission, a detailed study demonstrating to the satisfaction of the Corps and the Commission that provision of water supply storage and modification of Francis E. Walter Dam will not adversely affect the integrity and safety of the Francis E. Walter Dam.
- b. Selection of final design storage elevations for the modified Francis E. Walter Reservoir Project shall be made in consultation between the Corps of Engineers and the Commission, with careful consideration to avoid and/or mitigate impacts upon historical sites and areas of unique or special aesthetic or environmental value.
- c. The type and phasing of recreation development at the Francis E. Walter Reservoir Project will be determined in consultation among the Corps of Engineers, the Commission, the Commonwealth of Pennsylvania and the affected counties and municipalities. Full consideration shall be given to minimizing the impacts of such development upon municipal services and the environment of neighboring communities.

- d. Following completion of required studies, design plans, and the environmental impact statement, this project shall be subject to final review and approval by the Commission pursuant to Sections 3.8 and 11.1 of the *Compact*.

Current Status

The Corps of Engineers has classified the project as “inactive”.

2. Revised Comprehensive Plan Description of the Prompton Reservoir and Proposed Modification Project

Description

The Prompton Project, a single-purpose flood control project (with incidental recreation use) completed in 1960, would be modified for multiple-purpose use to provide supplies of water and recreation benefits, as would as the presently designed flood control function. The Prompton Dam is located in the valley of Lackawaxen River approximately one-half mile upstream of the confluence of Waymart Branch with the River, and approximately four miles west of Honesdale, Pennsylvania. The present dam controls 60 square miles of drainage area, and is 1,300 feet long and 140 feet high.

The long-term storage and operation for multiple-purposes would require the following additions or modifications to the existing structures:

1. A control tower with gates to control releases from the reservoir and a service bridge.
2. A blanket of impervious material on the valley wall and floor upstream of the dam.
3. Widening of the spillway.
4. Clearing of reservoir land and relocating roads subject to inundation.

The project long-term storage reservoir would extend about 4.4 miles upstream of the dam and inundate an additional 380 acres of hardwood forest and grassland. Studies by the Corps of Engineers during the detailed design stage addressed dam safety as a result of adding water supply as a project purpose.

Functions

Supplies of Water. The modified project would augment the flow of the Delaware River at Trenton by 130 cfs on the basis of complete and uniform drawdown of flow augmentation storage (30,900 acre-feet) over a 120-day period.

Reduction of Flood Damage. Flood heights on the Lackawaxen River are substantially reduced by the existing flood control storage of the Prompton Project and the General Edgar Jadwin Dam and Reservoir on Dyberry Creek, above Honesdale, Pennsylvania. The Towns of Honesdale, located at the confluence of Dyberry Creek with the Lackawaxen River, and Hawley, located between the junctions of Middle and Wallenpaupack Creeks with the Lackawaxen River, and several villages and townships located on the lower reaches of the Lackawaxen River, are protected. Conversion of the Prompton Dam and Reservoir to a multiple-purpose development would preserve the flood control function of this project as originally authorized, and flood reduction benefits would be unaffected by the proposed modification. The Corps of Engineers, during the detailed design stage, has documented the effect on the existing flood control capability of adding water supply storage as a project purpose and confirmed that there would be no reduction in the authorized flood control protection.

Recreation. Due to lack of suitable terrain, recreation potential at this project is limited. However, lands suitable for day-use recreation may be included in the plan of improvement. Operation of the project would consider the downstream flow requirements for stream fisheries and the management of the impoundment for lake fisheries as a coordinated element for full realization of the recreational potential of the project. The impact on nearby communities of adding recreation as a project purpose will be determined during the environmental review of the modification. The Commonwealth of Pennsylvania would cooperate with the communities involved to minimize potential adverse impacts.

Proposed Operating Policy

Releases from the project shall be coordinated with releases from the New York City reservoirs and accounted for at the Montague gaging station in accordance with the following policy:

1. When New York City is releasing from its reservoir, by direction of the River Master,
To meet Montague flow objectives:
 - a. inflow to Prompton may be passed through the reservoir and released downstream with no change in the Montague flow objective, or stored in the reservoir with an equivalent reduction in the Montague flow objective;
 - b. releases may be made from Prompton storage to meet Trenton flow requirements, and such releases will not be counted as part of the Montague objective.
2. When New York City is not releasing from its reservoir to meet Montague flow objectives:
 - a. inflow at Prompton may be stored (except for minimum conservation releases);
 - b. releases may be made from Prompton storage to meet Trenton flow requirements, and such releases will not be counted as part of the Montague objective.

Schedule

Modification of the existing Prompton Project will be reconsidered after completion of additional flow needs analysis.

Approval of this project is subject to the following conditions:

- a. The Corps of Engineers shall complete and submit to the Commission a detailed study demonstrating to the satisfaction of the Corps and the Commission, that provision of water supply storage in Prompton Reservoir will not adversely affect the integrity and safety of Prompton Dam.
- b. The Corps of Engineers shall complete and submit to the Commission, appropriate studies and analyses demonstrating that provision of water supply storage will not reduce the authorized flood control protection in Prompton Reservoir or significantly increase the risk to downstream areas of flood damages incurred during a design flood.

- c. New or increased recreation facilities at Prompton Reservoir will be planned, located and developed in phases in such manner as to minimize and mitigate potential adverse impacts on neighboring communities.
- d. Following completion of required studies, design plans, and the environmental impact statement, this project shall be subject to final review and approval by the Commission pursuant to Sections 3.8 and 11.1 of the *Compact*.

3. Revised Comprehensive Plan Description of the Tocks Island Project

Description

The Tocks Island Project is intended for multi-purpose development to provide water supplies, flood control, hydroelectric power, and recreation. The dam site is on the Delaware River about five miles upstream from the Delaware Water Gap, at the downstream end of Tocks Island. The contributing drainage area is 2,912 square miles, exclusive of 915 miles that contribute to the Neversink, Pepacton, and Cannonsville Reservoirs of the City of New York. The dam is designed to contain approximately 3,500,000 cubic yards of earth and rock, be 2,600 feet long, and rise 160 feet above the river bed to Elevation 455. Consideration would also be given to the development of hydroelectric power, including pumped storage. Storage allocations, as determined from studies by the Corps of Engineers, indicate 96,300 acre-feet of inactive long-term storage to Elevation 356; 425,600 acre-feet of active long-term storage for supplies of water, power, recreation, and other uses to Elevation 410; and 323,500 acre-feet of short-term storage for flood control to Elevation 432. The reservoir, at Elevation 410, will extend approximately 24 miles of affected roads and Delaware Water Gap National Recreation Area facilities. Protective works are proposed for construction along the banks of the Delaware and Neversink Rivers at Port Jervis, New York, and Matamoras, Pennsylvania, to protect up to Elevation 432, the top of the flood control pool. The 37-mile section of the Delaware River that will be covered by the reservoir is a component of the National Wild and Scenic Rivers System. The impoundment at Elevation 410 would inundate an additional 10,000 acres of land in addition to the 2,425 acres now covered by the existing river.

Functions

Supplies of Water. Use of 425,600 acre-feet of active long-term storage at Tocks Island Project would augment the flow of the Delaware River at Trenton by 1,790 cfs on the basis of complete and uniform drawdown of flow augmentation storage over a 120-day period. Net yield at the site on a year-round basis will be approximately 980 cfs.

Reduction of Flood Damage. The 1955 flood damages in the reach from Tocks Island to Burlington, New Jersey, exceeded 85 percent of the total damages for the mainstem of the Delaware River, and occurred principally at the damage centers of Easton, Riegelsville, New Hope, and Yardley, Pennsylvania; and Belvidere, Phillipsburg, Trenton, and Burlington, New Jersey. Damages in this reach would be substantially reduced, if the 1955 flood reoccurred, by system operation of the flood-control storage at Tocks Island with other projects in the Comprehensive Plan; the stage of the 1955 flood at Trenton would be reduced by six feet.

Power. The Tocks Island Project was originally considered for a conventional hydropower installation of 46,000 kilowatts, a dependable capacity of 20,000 kilowatts, and an average production of 281.5 million kilowatt hours. Re-evaluation of conventional and pumped-storage power schemes resulted in deletion of the conventional hydropower installation from the Comprehensive Plan. In light of current and future uncertainties regarding energy supplies, a full re-evaluation of the total power potential of the site would be called for if the project is reconsidered after the year 2000.

Recreation. Recreation capacity and facilities of the existing Delaware Water Gap National Recreation Area, developed under P.L. 89-158, would be altered to an extent to be determined by future studies. Reservoir operation would consider fisheries within the impoundment and downstream of the dam. Passage for anadromous fisheries would be provided and consideration given to additional flow augmentation from this project in October and November for moving fish population through the zone of low dissolved oxygen in the estuary.

Environmental Impact Studies

A complete review of the environmental impacts of the project will be required. Possible adverse impacts that should be assessed include, but are not limited to, the following:

1. Reservoir water quality, including eutrophication
2. Fish and wildlife, including passage of anadromous fish and estuary oyster projection and maintenance
3. Archaeology and historic sites
4. Transportation requirements related to recreational visitation
5. Local governmental services
6. Lake versus free-flowing river recreation
7. Vegetation
8. Reservoir level fluctuations

Schedule

The Tocks Island Project is placed in reserve for water supply development, if needed.

Current Status

The Corps of Engineers has classified the project as “de-authorized”.

Section II-B Major Existing Projects

1. CANNONSVILLE RESERVOIR

Description: Cannonsville Reservoir, part of the water supply system of the City of New York, is located on the West Branch of the Delaware River in Delaware County, New York, about four miles upstream of the village of Deposit. It was financed and constructed by the City of New York and placed in operation in 1967.

Cannonsville dam is approximately 2,800 feet long (at the top) with a maximum height of about 175 feet above the original river channel. It has a top width of about 45 feet and is of the compacted (rolled) earth type. At its northerly contact with the valley wall there is a spillway. Spillage is directed into a channel, through a stilling basin, and into an outlet channel that guides the flow into the West Branch of the Delaware River.

Cannonsville Reservoir covers roughly 4,800 acres at flow line elevation, 1,150 feet above mean sea level, with a capacity above sill elevation 1,027.5 of some 97 billion gallons, and impounds the runoff from a watershed of about 450 square miles. The yield therefrom is used for supplying water to the City of New York, for conservation releases to the West Branch Delaware River, and, together with releases obtainable from the Neversink and Pepacton reservoirs, for meeting the Montague formula of the Supreme Court Decree of 1954.

Cannonsville Reservoir was investigated for modification to increase the storage as recommended in the Good Faith Recommendations and determined by New York City as not feasible.

Modification of Cannonsville could add approximately 13 billion gallons of additional storage capacity. Additional project yield could be used primarily to maintain conservation releases. Secondary purposes could be to support Montague flow objectives and diversions to New York City within the limits of the 1954 Supreme Court Decree. Improvements to the release works to allow enhancement of the present augmented conservation release program and to permit more flexible adjustment of release rates to meet varying conditions have been installed (1998).

2. BELTZVILLE PROJECT

Description

The Beltzville Project was constructed by the Corps of Engineers as a multiple-purpose development to provide supplies of water, flood control and recreation. The Beltzville Dam site is located in the Pohopoco Valley approximately 0.3 mile upstream from the confluence of Sawmill Run and Pohopoco Creek, and approximately four miles east of Lehigh, Pennsylvania (see Plate 1). The net contributing drainage area above this site is 75 square miles, excluding 22 square miles that contribute to the Wild Creek Reservoir, which supplies water to the City of Bethlehem, Pennsylvania. The earth and rock fill dam extends for a length of 4,500 feet and rises 160 feet above the creek bed. Diversion flows and low level reservoir releases pass through a conduit constructed on rock along the right side of the valley. A spillway is constructed around the north end of the dam with the channel in bedrock. Flow from the spillway discharges into Sawmill Run and then back into Pohopoco Creek. Storage allocations for the Beltzville Project are 1,200 acre-feet of inactive long-term storage to Elevation 625; 40,000 acre-feet of active long-term storage for supplies of water and recreation to Elevation 615; and 27,000 acre-feet of short-term storage for flood control to Elevation 641. When full up to spillway crest Elevation 641, the reservoir extends approximately seven miles upstream.

Functions

Supplies of Water. Use of 40,000 acre-feet of active long-term storage at the Beltzville Project provides a net yield of 80 cfs. This augmentation contributes to the satisfaction of the needs of the Palmerton, Bethlehem and Trenton-Philadelphia areas.

Reduction of Flood Damage. The flood control storage at the Beltzville Project contributes to flood stage reductions at the principal damage centers on the Lehigh River below the confluence with Pohopoco Creek. These damage centers are located at Bowmanstown, Walnutport, Northampton, Hokendauqua, Catasauqua, Allentown, Bethlehem, Freemansburg and Easton, Pennsylvania. Combined operation of the three major Comprehensive Plan flood control projects (Beltzville, Penn Forest, and Wild Creek) in the Lehigh River Basin will result in a stage reduction of two feet at Bethlehem, Pennsylvania, for a flood similar to that experienced in 1955. This reduction is in addition to the effects of the F.E. Walter Project.

Recreation. The Beltzville Reservoir provides a recreation capacity for 500,000 visitors annually, of which 110,000 are credited to directly related recreation uses. The lands acquired specifically for recreation development provide for public ownership of the shore area and for development of five recreation sites. Facilities provide for one-day outings. Operation of the project considers the downstream flow requirements for stream fisheries and the management of lake fisheries as a coordinated element for full realization of the recreation potential of the project.

3. BLUE MARSH PROJECT

Description. The Blue Marsh Project, as constructed by the Corps of Engineers, is a multiple-purpose development providing supplies of water, flood control and recreation. The Blue Marsh Dam is located on the Tulpehocken Creek, one and one-half miles upstream from the mouth of Plum Creek, and approximately six miles northwest of Reading, Pennsylvania (see plate 2). The drainage area above this site is 175 square miles. The dam is a rock and earth fill embankment 1,100 feet long and 90 feet high. The spillway is located approximately 1,000 feet south of the dam where a 900-foot wide flat crested channel cut into the shale conveys excess water from the reservoir to Tulpehocken Creek. Storage allocations for the Blue Marsh Project are 3,002 acre-feet of inactive long-term storage to Elevation 261; 14,500 acre-feet of active long-term storage for supplies of water and recreation to Elevation 280; and 33,000 acre-feet of short-term storage for flood control to Elevation 307. The reservoir extends upstream from the dam approximately 10 miles on Tulpehocken and Northkill Creeks. The reservoir required relocation of pipelines, roads, the community of Blue Marsh and a few buildings in the Bernville area. One commercially valuable mineral deposit is located in the reservoir, a shale pit approximately one mile north of Blue Marsh. A total of 5,296 acres of land was acquired for the complete development. In addition to the 1,520 acres required for construction of the project, 1,093 acres are required for directly related recreation and 2,688 acres for indirectly related recreation.

Functions.

Supplies of Water. Use of 14,600 acre-feet of active long-term storage at the Blue Marsh Project provides a net yield of 65 cfs. This flow augmentation contributes to the water supply needs of the Pottstown-Reading area as well as to the Philadelphia area.

Reduction of Flood Damage. The flood control storage at the Blue Marsh Project contributes to flood stage reductions at the principal damage centers on the Schuylkill River from Reading, Pennsylvania to Philadelphia, Pennsylvania. These damage centers are Reading, Birdsboro, Pottstown, Norristown, Conshohocken, Manayunk and Philadelphia, Pennsylvania.

Recreation. The Blue Marsh reservoir provides a recreation capacity to accommodate approximately 438,000 visitors annually, of which approximately 137,000 recreationally use the facility. The lands acquired specifically for recreation development provide public ownership of the shoreline and space for the development of six recreation sites. Facilities provide for one-day outings. Necessary access, sanitary and administrative facilities are also provided.

Current Status

The Corps of Engineers has classified the project as “operational”.

4. NOCKAMIXON-TOHICKON PROJECT

Description. The Nockamixon-Tohickon Project, developed in two stages, is a multiple-purpose project to provide supplies of water and recreation and to satisfy existing recreation needs. Land was acquired as it became available. Such an arrangement assured adequate capacity at the reservoir which is considered essential to water supply needs in the Basin after the year 2010. The project is located on Tohickon Creek approximately one mile southwest of Ottsville, Pennsylvania. The drainage area above the dam site is 75 square miles. Storage allocations at capacity, as reported by the Corps of Engineers, are 1,500 acre-feet of inactive long-term storage to Elevation 335; and 30,000 acre-feet of active long-term storage for supplies of water and recreation to Elevation 388. The reservoir at Elevation 388 extends approximately six and one-half miles upstream. Total lands, including the reservoir area, at this project includes approximately 4,500 acres.

Functions.

Supplies of Water and Recreation . It has been estimated that flow augmentation from this project will not be required for the satisfaction of water needs until after the year 2010. Accordingly, the Pennsylvania Department of Environmental Protection (PADEP) classifies the facility for recreational uses only. The structure provides a storage pool for that purpose to approximately Elevation of 375, but is so designed as to permit raising or adaptation at a later date to provide a storage pool to approximately Elevation of 388 when needed for water supply.

The recreation area is primarily developed for day-use activities, and it is estimated that over one million visitors annually are accommodated.

5. BRANDYWINE PROJECT (Revised by Resolution 62-21)

Reference. The Brandywine Watershed Plan was developed by the former U.S. Soil Conservation Service and the Commonwealth of Pennsylvania's former Department of Forests and Waters, at the request of, and in cooperation with the local people of the Brandywine watershed. The 330 square mile drainage area is located in the southeastern corner of Pennsylvania and the most northern part of Delaware (see Plate 11). Details regarding the watershed and the improvements are contained in the Commonwealth of Pennsylvania, Department of Forests and Waters *Report on Water Resources Study of the Brandywine Creek Basin in Pennsylvania*, dated November 1959, and in the *Watershed Work Plan for the Brandywine Creek Basin*, dated March 1959 and prepared by local sponsoring organizations with assistance from the former U.S. Soil Conservation Service.

Water problems and plan of improvement. The major water problems of the area were flood damages and municipal and industrial water supply. New water-based recreation areas and facilities are also important to the area. Direct average annual flood damages were estimated at \$203,000 (1959). Direct damages from the flood of August 1955 were approximately \$643,000 (1959). The plan of improvement provides for the construction of up to 12 reservoirs: five for flood control, water supply and recreation; and seven smaller reservoirs for flood control and limited recreation. Channel improvement in the vicinity of Coatesville was also included. Land treatment measures include cover cropping, contour farming, strip cropping, establishment of perennial hay, pasture improvement, grassed waterways, diversion terraces, tree planting, improvement cuttings and fencing farm woodlots.

Current Status

The Natural Resources Conservation Service (NRCS), formerly the U.S. Soil Conservation Service, has completed 6 reservoirs: two single purpose dams, three multipurpose dams, and one recreational facility. One major multipurpose reservoir including water supply was completed in Pennsylvania. However, all proposed water supply reservoirs were not constructed and water supply alternatives have been under various stages of study for many years in New Castle County, Delaware. Many steps have been taken to provide additional water supplies and these have been included in the Comprehensive Plan by specific Docket actions. (Reference DRBC Dockets D84-10CP and all supplements).

6. LITTLE SCHUYLKILL PROJECT

Reference. The Little Schuylkill Watershed Plan was sponsored by the Schuylkill, Carbon and Berks County Soil conservation Districts, Schuylkill County Commissioners, Tamaqua Borough Council, the Pennsylvania Fish and Boat Commission, and the former Pennsylvania Department of Forests and Waters. The watershed is a 136-square mile area, the principal portion of which lies in the eastern part of Schuylkill County, Pennsylvania. Details of the watershed plan are contained in the report, *Watershed Work Plan for Watershed Protection and Flood Prevention, Little Schuylkill River Watershed*, dated April 1958, prepared by the local sponsoring organizations with assistance from the former U.S. Soil Conservation Service and U.S. Forest Service.

Current Status

The Natural Resources Conservation Service, formerly the Soil Conservation Service, has completed 6 reservoirs: four single purpose dams and one multipurpose dam, and one recreational facility, as proposed. In addition, one channel modification project was completed.

7. LACKAWAXEN TRIBUTARIES PROJECT

Reference. The Lackawaxen Tributaries Watershed Plan was sponsored by the Wayne County Soil Conservation District and the Wayne County Commissioners. The watershed area encompassed by the plan is 41.6 square miles, and lies in the southeastern portion of Wayne County, Pennsylvania (see plate 13). It consists of that portion of the Lackawaxen River watershed lying between the Towns of Honesdale and Hawley, Pennsylvania. The plan concentrates on four tributaries on the east side of the Lackawaxen River: Carley Brook, Laurella Brook, Indian Orchard Creek, and Lollipop Creek. Details of the watershed plan are contained in the report, *Watershed Work Plan for Watershed Protection and Flood Prevention, Lackawaxen Tributaries Watershed*, dated March 1958, prepared by the sponsoring organizations with assistance from the former U.S. Soil Conservation Service and U.S. Forest Service.

Current Status

The Natural Resources Conservation Service, formerly the U.S. Soil Conservation Service, has completed seven single purpose dams, as proposed.

8. BROADHEAD CREEK PROJECT

Reference. The Broadhead Creek Watershed Plan was sponsored by the Monroe and Pike County Soil Conservation Districts, and the Monroe and Pike County Commissioners. The watershed is 29.1 square miles in area. Its downstream boundary lies just above the Spruce Cabin Run-Broadhead confluence at Canadensis, Pennsylvania (see plate 14). Details of the watershed plan are set out in a report, *Watershed Work Plan, Broadhead Creek Watershed*, dated March 1961, prepared by the sponsoring organizations with assistance from the former U.S. Soil Conservation Service and U.S. Forest Service.

Current Status

The Natural Resources Conservation Service, formerly the Soil Conservation Service, has completed two single purpose dams, as proposed.

9. GREENE-DREHER PROJECT

Reference: The Greene-Dreher Watershed Plan was sponsored by the Wayne, Pike and Monroe County Boards of Commissioners and the Wayne, Pike and Monroe County Soil Conservation Districts. The watershed is part of the larger watershed of Wallenpaupack Creek upstream from its junction with the West Branch and Lake Wallenpaupack in Pennsylvania. It is a 74.7 square mile area (see plate 15). Details of the watershed plan are contained in a report, *Watershed Work Plan for Watershed Protection and Flood Prevention, Greene-Dreher Watershed*, dated May 1959, prepared by the sponsoring organizations with assistance from the former U.S. Soil Conservation Service and U.S. Forest Service.

Current Status

The Natural Resources Conservation Service, formerly the Soil Conservation Service, has completed two single purpose dams, as proposed.

10. SILVER LAKE-LOCUST ISLAND PROJECT

Reference. The Silver Lake-Locust Island Watershed Plan was sponsored by the Salem-Cumberland Soil Conservation District, the Locust Island and Thorofare Meadow Companies, and the Township Committee of Lower Alloways Creek Township. The watershed covers approximately 8.6 square miles in the southern tip of Salem County, New Jersey (see plate 17). Details of the watershed and the plan of improvement are contained in a report, *Watershed Work Plan for Watershed Protection, Flood Prevention and Water Management, Silver Lake-Locust Island Watershed*, dated January 1957, prepared by the local sponsoring organizations with assistance from the former U.S. Soil Conservation Service.

Current Status

The Natural Resources Conservation Service, formerly the U.S. Soil Conservation Service, completed the structural measures consisting of 3.5 miles of dike with vegetative cover as proposed.

11. PAULINS KILL PROJECT

Reference. The Paulins Kill Watershed Plan was sponsored by the Warren and Sussex County Soil conservation Districts, and the Towns of Blairstown and Newton, New Jersey. The 171 square mile watershed is drained by the Paulins Kill which meanders 42 miles from the headwaters above Newton, New Jersey, to the mouth at Columbia on the Delaware River (see plate 18). Details of the watershed and the plan of improvement are contained in a report, *Watershed Work Plan for the Paulins Kill Watershed*, dated October 1958, prepared by the local sponsoring organizations with assistance from the U.S. Soil Conservation Service and U.S. Forest Service.

Current Status

The Natural Resources Conservation Service, formerly the Soil Conservation Service, has completed three floodwater retarding structures as proposed.

12. MAURICE RIVER COVE PROJECT

Reference. The Maurice River Cove Watershed Plan was sponsored by the Townships of Maurice River and Commercial, the Salem-Cumberland Soil Conservation District, and the Division of Fish and Game of the New Jersey Department of Conservation and Economic Development. The 10.6 square mile watershed lies in the southern end of Cumberland County, New Jersey, at the point where the Maurice River enters Delaware Bay (see plate 19). Approximately 65 percent of the area is marshland. Details of the watershed and the plan of improvement are contained in a report, *Watershed Work Plan for the Tributaries of Maurice River Cove Watershed*, dated October 1960, prepared by the local sponsoring of organizations with assistance from the former U.S. Soil Conservation Service.

Current Status

The Natural Resources Conservation Service, formerly the Soil Conservation Service has completed four water control structures and 12,000 feet of dike as proposed.

SECTION II-C PRE-COMPACT MUNICIPAL PROJECTS

TABLE 1

List of pre-Compact water supply projects included in Addendum No. 1 of the Comprehensive Plan (1962) and not been subject to any subsequent review by the Commission.

PRIMARY/ORIGINAL NAME	SECONDARY/CURRENT NAME	RIVER MILE	ESTIMATED EQUIVALENT POPULATION SERVED (x1000)	ESTIMATED CAPACITY (MGD)

Section II - D

This list contains projects added to the Comprehensive Plan through July 2001 by docket actions of the Commission in accordance with Sections 3.2 and 13.1 of the Compact. Full project descriptions are not included here, but are provided in the referenced Docket for each project.

Although projects are added to this list upon Commission approval, a project's inclusion in the comprehensive plan is subject to its completion within a reasonable period of time. For information regarding the status of a particular project, please consult the Project Review Branch staff.

SECTION III

A. National Recreation Areas

B. State Recreation Areas

SECTION III: MAJOR (Non Urban) Recreation Areas

PART A

Federal Areas

1. Corps of Engineers

In addition to the U.S. Army of Corps. of Engineers construction and operation of recreation areas at major reservoir projects (as described in each applicable docket decision) other federal agencies own and/or operate non-urban recreational areas in the basin.

2. National Park Service

Delaware Water Gap National Recreation Area

This park preserves 40 miles of the middle Delaware River and almost 70,000 acres of land along the river's New Jersey and Pennsylvania shores. At the south end of the park, the river cuts eastward through a scenic water gap in the Appalachian Mountains. Canoeing, camping, fishing, swimming, hiking; viewing wildlife, geologic features and natural scenery – all this and more await our visitors. The park includes historic Millbrook Village and several environmental education centers.

The recreation area was originally envisioned as lands surrounding the proposed Tocks island Reservoir. Early planning, management and land acquisitions were accomplished amid much controversy over the dam project. In 1978, Congress designated the section of the Delaware River within Delaware Water Gap National Recreation Area as part of the National Wild and Scenic Rivers System. In 1992 the Tocks Island Dam project was officially de-authorized.

QUICK FACTS

Annual Visitation is 5,132,149 (1999)

Park Covers 66,761 Acres

Designations

National Recreation Area – September 1, 1965

National Scenic River – November 10, 1978

Hopewell Furnace National Historic Site

Hopewell Furnace National Historic Site is one of the finest examples of a rural American 19th century iron plantation. The buildings include a blast furnace, the ironmaster's mansion, and auxiliary structures. Hopewell Furnace was founded in 1771 and the furnace operated until 1883. Hopewell Furnace consists of 14 restored structures in the core historic area, 52 features on the List of Classified Structures, and a total of 848 mostly wooded acres. Hopewell Furnace National Historic Site is surrounded by French Creek State Park which preserves the lands the furnace utilized for its natural resources.

Hopewell Village National Historic Site – August 3, 1938

Hopewell Furnace National Historic Site – September 19, 1985

Independence National Historical Park

Independence National Historical Park, located in Philadelphia, is often referred to as the birthplace of our nation. At the park, visitors can see the Liberty Bell, an international symbol of freedom, and Independence Hall, a World heritage Site where both the Declaration of Independence and the U.S. Constitution were created. In addition, the park interprets events and the lives of the diverse population during the years when Philadelphia was the capital of the United State from 1790 to 1800. A section of the park where Benjamin Franklin's home once stood is dedicated to teaching about Franklin's life and accomplishments. Spanning approximately 45 acres the park has about 20 buildings open to the public.

Upper Delaware Scenic and Recreational River

As part of the National Wild and Scenic Rivers System, the Upper Delaware Scenic and Recreational River stretches 73.4 miles (118.3 km) along the New York-Pennsylvania border. The longest free-flowing river in the Northeast, it includes riffles and Class I and II rapids between placid pools and eddies. Public fishing and boating accesses are provided, although most land along the river is privately owned. Wintering bald eagles are among the wildlife that may be seen here. This unit of the National Park Service is also home to John Roebling's Delaware Aqueduct and the Zane Grey Museum in Lackawaxen, PA.

QUICK FACTS

Annual Visitation is 356,486 (1999)

Park Covers 75,055 Acres

Designations

National Wild and Scenic River – November 10, 1978

Valley Forge National Historical Park

At Valley Forge the Continental Army under General George Washington's leadership built upon its growing military competence. Through intensive training, the army honed its skills and became a professional force that marched on to victory over the British and secured America's independence in 1783. In the last nineteenth century, the narrative of Valley Forge inspired private citizens to begin the effort to preserve the site of General

Washington's soldiers' camp as a memorial. Formal recognition for the troops who wintered at Valley Forge came when the Pennsylvania legislature designated the area as a state park in 1893. Valley Forge officially became part of the national park system in 1977. Today, the mission of the National Park Service at Valley Forge is to preserve, protect and maintain the natural and cultural resources that are associated with and commemorate the encampment of the Continental Army in 1777/1778 and educate the American people about one of the most defining events in the nation's history.

QUICK FACTS

Annual Visitation is 7,102,066 (1999)

Units of the National Wild and Scenic River System in the Delaware River Watershed

Maurice National Scenic and Recreational River

In 1993, the Maurice River and several tributaries – including Menantico and Muskee Creeks and the Manumuskin River – were added to the National Wild and Scenic River System. The Maurice (pronounced “morris”) River corridor is an unusually pristine Atlantic Coastal river with national and internationally important resources. As part of the Atlantic Flyway, its clean water and related habitats are vitally important to the migration of shorebirds, songbirds, waterfowl, raptors, rails and fish. Other important resources include a rare and endangered joint vetch, shortnose sturgeon, striped bass, and a prehistoric settlement site. Historically, the Maurice is home to a rich fishing, boating and oystering heritage. The Maurice River flows through what was once an oyster harvesting town; you can still see buildings and activities related to this industry. The river supports New Jersey's largest stand of wild rice and 53 percent of the animal species that New Jersey has recognized as endangered, excluding marine mammals.

The Maurice River is a critical link between the Pinelands National Reserve and the Delaware Estuary – both nationally and internationally important. The Maurice River corridor serves as the western boundary of the Pinelands and includes the cities of Vineland and Millville, and the Townships of Maurice River, Commercial and Buena Vista.

QUICK FACTS

Classification/Mileage: Scenic – 28.9 miles; Recreational – 6.5 miles;

Total – 35.4 miles.

Designations

National Scenic and Recreational River – December 1, 1993

Lower Delaware National Scenic and Recreational River

The lower Delaware River from the Delaware Water Gap to Washington Crossing, the boundary between New Jersey and Pennsylvania, flows through rolling hills, broad valleys, and cliffs carved by the river. The river corridor supports a startling variety of plants, ranging from cactus to arctic–alpine plants. Shad, sturgeon, and striped bass are abundant. The lower Delaware is also rich in cultural history, including 29 national historic districts and eight national landmarks. On Christmas Day in 1776, George Washington crossed the lower Delaware on his way to victory over the British near Trenton. In addition, the lower Delaware River provides close to home recreational opportunities for the 5 million people that live in the Delaware Valley. The national designation includes three tributaries in Pennsylvania, the Paunacussing, Tinicum, and Tohickon creeks.

QUICK FACTS

Classification/Mileage: Scenic – 25.4 miles; Recreational – 40.2 miles;
Total – 65.6 miles.

Designations

National Scenic and Recreational River – November 1, 2000

White Clay Creek National Scenic and Recreational River

The White Clay Creek watershed is one of only a few relatively unspoiled river systems remaining in the highly developed corridor between Philadelphia and the Wilmington-Newark metropolitan areas. This watershed, which encompasses urban, suburban and rural areas, is renowned for its scenery, opportunities for birding and trout fishing, and historic features. The watershed is also an important source of drinking water for residents of Pennsylvania and Delaware. Community interest in designating White Clay Creek as a national wild and scenic river was prompted by concerns about increased pollution, a decline in migrating birds, and receding forests resulting from urbanization.

QUICK FACTS

Classification/Mileage: Scenic – 24 miles; Recreational – 167 miles;
Total – 191 miles.

Designations

National Scenic and Recreational River – October 24, 2000

3. U. S. Fish and Wildlife Refuge

National Wildlife Refuges in the Delaware River Watershed

Bombay Hook National Wildlife Refuge

Bombay Hook National Wildlife Refuge in Smyrna, Delaware comprises 15,122 acres. Approximately three-quarters of the refuge is tidal salt marsh. The Refuge was established in 1937, as a link in the chain of waterfowl refuges that extends from Canada to the Gulf of Mexico. It is primarily a refuge for migrating and wintering ducks and geese, but also offers haven for numerous other species of migratory birds. The value and importance of

Bombay Hook for the protection and conservation of waterfowl has increased greatly in the past 25 years, primarily due to the loss of extensive surrounding marshland to urban and industrial development. It also includes 1,100 acres of impounded fresh water pools, brushy and timbered swamps, 1,000 acres of agricultural lands, and lumbered and grassy upland. The general terrain is flat and less than ten feet above sea level.

Cape May National Wildlife Refuge

The Cape May National wildlife was established in January 1989. The U.S. Fish and Wildlife Service acquired the Refuge's first (90-acre) parcel from The Nature Conservancy in June of that year. Since then the Refuge has grown to more than 8000 acres as the Service continues to buy land. Ultimately the Refuge will protect 16,700 acres of precious wildlife habitat in New Jersey's Cape May Peninsula. The Refuge's key location in the Atlantic will ensure availability of critical habitat to hundreds of thousands of migratory birds each year as these long-distance flyers travel along the New Jersey coast.

Because of its importance to migratory waterfowl, Cape May Refuge has been designated a Flagship Project of the North American Waterfowl Management Plan: a far-reaching international agreement to conserve and restore millions of acres of wetlands habitats throughout the United States Canada and Mexico. This massive project is a partnership of private individuals and businesses conservation organizations and State and Federal agencies. Because of the Delaware Bay Estuary's value to migrating shorebirds and wading birds in 1992 it was designated a Wetland of International Importance under the Convention on Wetlands of International Importance—otherwise known as the Ramsar Convention. At the local level the Refuge also plays an active role in the long-term protection of a vital multi-agency-administered greenbelt corridor reaching from the Delaware Bay to Egg Harbor Bay.

The Refuge has two separate Divisions. The Delaware Bay Division is located in Middle Township and extends along five miles of the Delaware Bay. The Great Cedar Swamp Division straddles Dennis and Upper Townships. The 16700-acres proposed acquisition area contains a wide range of habitats including upland and lowland forests, fields, barrier beach, salt marsh and salt meadows cut through by meandering tidal creeks.

QUICK FACTS

8000+Acres

Established January 1989

John Heinz National Wildlife Refuge

The John Heinz National Wildlife Refuge at Tinicum is administered by the Department of Interior's U.S. Fish and Wildlife Service and is located in Philadelphia and Delaware Counties, Pennsylvania, about 1 mile from the Philadelphia International Airport. The refuge was established by an act of Congress in 1972 to protect the last 200 acres of freshwater tidal marsh in Pennsylvania. When acquisition is complete, it will consist of 1200 acres of varied habitats. Over the years, the refuge has become a resting and feeding

area for more than 280 species of birds, 80 of which nest here. Fox, deer, muskrat, turtles, fish, frogs and a wide variety of wildflower and plants call the refuge “home”.

QUICK FACTS

120 Acres

Established 1972

Prime Hook National Wildlife Refuge

The Prime Hook National Wildlife Refuge in Milton, Delaware was established in 1963 primarily to preserve coastal wetlands as wintering and breeding habitat for migratory waterfowl. It is located on the west shore of Delaware Bay, approximately 22 miles southeast of Dover, the State capital, and 64 miles southeast of Wilmington, Delaware.

The refuge consists of 8,817 acres, approximately 6,800 acres of which are fresh marsh, tidal marsh, and water. Other habitat includes 850 acres of timber and brush and 1,100 acres of grasslands and croplands. The refuge provides nesting habitat for wood ducks, black ducks, and other species. Overall refuge management is directed toward providing a variety of habitat types for maximum wildlife diversity.

Supawna Meadows National Wildlife Refuge

Supawna Meadows lies along the Delaware River north of Salem River, in Pennsville Township, Salem County. Approximately 75 percent of the currents 2,500 acres is brackish tidal march. The refuge provides wintering and migrating waterfowl with an important feeding and resting area. Management of the refuge centers around the protection and enhancement of high quality habitat for use by migratory birds (waterfowl, wading birds, songbirds, woodcock and shorebirds).

SECTION III

PART B No. 1

DELAWARE

NO. 92-1

A RESOLUTION to revise the Comprehensive Plan of the Delaware River Basin Commission with respect to recreation areas in the State of Delaware included therein.

WHEREAS, on March 28, 1962, the Delaware River Basin Commission adopted a Comprehensive Plan, Phase I by Resolution No. 62-4; and

WHEREAS, Resolution No. 62-4 and the Comprehensive Plan were subsequently amended on July 25, 1962 to include Addendum #1 entitled Delaware River Basin Commission, Comprehensive Plan, Phase I, Section VII – Pre-Existing Projects, which includes among others a list entitled Non-Urban Recreation Areas; and

WHEREAS, the list of Non-Urban Recreation Areas is inaccurate and does not reflect current conditions and desires of the signatory parties with respect to recreation areas to be included in the Commission's Comprehensive Plan; and

WHEREAS, by letter dated October 23, 1991, the State of Delaware, Department of Natural Resources and Environmental Control, Division of Parks and Recreation, requested the Delaware River Basin Commission to revise its Comprehensive Plan with respect to state recreation areas within the Delaware River Basin; now therefore

BE IT RESOLVED by the Delaware River Basin Commission:

1. All references to Delaware State, County, and Municipal Areas and Commercial Developments included on the 1962 list of Delaware Non-Urban Recreation Areas are hereby deleted from the Comprehensive Plan and are replaced by the attached lists of Delaware water-related recreation facilities. Location maps for each facility are on file.
2. Recreation facilities included on the attached list which have been included previously in the Comprehensive Plan by separate DRBC action are subject to any conditions or restrictions specified therein, and this listing shall not serve to replace or alter any of those respective Docket decisions.

Part B No. 2

NEW JERSEY

NO. 91-19

A RESOLUTION to revise the Comprehensive Plan of the Delaware River Basin Commission with respect to recreation areas in the State of New Jersey included therein.

WHEREAS, on March 28, 1962, the Delaware River Basin Commission adopted a Comprehensive Plan, Phase I by Resolution No. 62-4; and

WHEREAS, Resolution No. 62-4 and the Comprehensive Plan were subsequently amended on July 25, 1962 to include Addendum #1 entitled Delaware River Basin Commission, Comprehensive Plan, Phase I, Section VII – Pre-Existing Projects, which includes among others a list entitled Non-Urban Recreation Areas; and

WHEREAS, the list of Non-Urban Recreation Areas is inaccurate and does not reflect current conditions and desires of the signatory parties with respect to recreation areas to be included in the Commission's Comprehensive Plan; now therefore

BE IT RESOLVED by the Delaware River Basin Commission:

1. All references to New Jersey State and County Areas and Commercial Developments included on the 1962 list of New Jersey Non-Urban Recreation Areas are hereby deleted from the Comprehensive Plan and are replaced by the attached lists of New Jersey water-related recreation facilities. Location maps for each facility are on file.
2. Recreation facilities included on the attached list which has been included previously in the Comprehensive Plan by separate DRBC action are subject to any conditions or restrictions specified therein, and this listing shall not serve to replace or alter any of those respective Docket decisions.

SECTION III

PART B No. 3

NEW YORK

The Catskill Forest Preserve

The Catskill Forest Preserve is the state land within the Catskill Park. Since its creation in 1885, it has grown from 34,000 to almost 300,000 acres. An 1894 amendment to the New York State Constitution (now Article 14) directs **“the lands of the State now owned or hereafter acquired, constituting the forest preserve as now fixed by law, shall be forever kept as wild forest lands. They shall not be leased, sold or exchanged, or be taken by any corporation, public or private, nor shall the timber thereon be sold, removed or destroyed.”** The forest preserve has thousands of acres of forests with meadows, remnants of old farmsteads, lakes, rivers, springs, waterfalls, cliffs, fire towers, bears, rattlesnakes and other wildlife, rare plants and animals. Also, there are hundreds of miles of abandoned woods, roads and trails to enjoy. Today, it serves as watershed, recreation area and ecological and scenic reserve.

The Catskill Park

The Catskill Park is a mountainous region of public and private lands in Ulster, Greene, Delaware and Sullivan Counties – the “forest preserve” counties. 98 peaks over 3,000 feet form an impressive skyline. Its blend of public and private lands is typical of large parks in Europe, where people and unique lands have coexisted for centuries. This special and often remote mountain landscape was only occasionally used by native Americans. Later it was settled and heavily exploited by the Dutch, English, Irish and Germans. Its rich history includes logging, bluestone quarrying, leather tanning, wintergreen and blueberry harvesting, trapping, fishing, mountain house tourism, railroads, and even World War II pilot training. Once heavily exploited, today a balance between the hands of man and that of nature is returning. Over 60% of lands in the Catskill Park are privately owned, the home of about 50,000 year round residents; the rest of publicly-owned “forest preserve.”

PART B No. 4

COMMONWEALTH OF PENNSYLVANIA

NO. 2000-22

A RESOLUTION to revise the Comprehensive Plan of the Delaware River Basin Commission with respect to recreation areas in the Commonwealth of Pennsylvania.

WHEREAS, on March 28, 1962, the Delaware River Basin Commission (Commission) adopted a Comprehensive Plan, Phase I by Resolution No. 62-4; and

WHEREAS, Resolution No. 62-4 and the Comprehensive Plan subsequently were amended on July 25, 1962 to include Addendum #1, entitled "Comprehensive Plan, Phase 1, Section VII – Pre-Existing Projects," which includes among other things a list entitled "Non-Urban Recreation Areas," and

WHEREAS, the list of Non-Urban Recreation Areas is inaccurate and does not reflect current conditions and the desires of the signatory parties with respect to inclusion of recreation areas in the Commission's Comprehensive Plan; and

WHEREAS, pursuant to Resolution Nos. 91-19 and 92-1, updated lists of recreation areas in New Jersey and Delaware respectively were included in the Comprehensive Plan; and

WHEREAS, the Commonwealth of Pennsylvania desires to update the Comprehensive Plan with respect to recreation areas within the Delaware River Basin; now therefore

BE IT RESOLVED by the Delaware River Basin Commission:

1. All Pennsylvania recreation areas included in the 1962 list of Non-Urban Recreation Areas are hereby deleted from the Comprehensive Plan and are replaced by the Pennsylvania State Parks and Forests presented on the attached lists.
2. Recreation areas included on the attached lists that previously have been included in the Comprehensive Plan by separate Commission action shall continue to be subject to any conditions or restrictions specified therein, and this action shall not serve to replace or alter any of those respective docket decisions.
